Real-Time and Multi-Agent Systems Ammar Attoui, 2012-12-06 This book is a translation of the accomplishment of the French engineer Ammar Attoui who has set out to bring together the works of computer scientists and automotive engineers Computer scientists have worked on the same type of systems as automotive engineers but have used different designs methods and tools The former call the resultant systems real time systems and the latter call them discontinuous event systems Today telecommunications systems of increasing performance and increasingly powerful multi task operating and real time systems offer the possibilities of the development of distributed structure applications organized in a group of asynchronous entities which communicate by the exchange of messages and events Hence combining the cultures of computer science and automotive engineering is essential to gain the benefits of unifying their techniques and methods in order to realize this potential The absence of the global state in distributed systems which is a result of the absence of a shared memory and unique repository makes communication via messaging the sole means which can be used under any circumstances Agents are conceptual communicating entities The book presents the methods and techniques which are necessary for the concrete implementation of the idea of an agent as an autonomous and reactive computing entity Multi agent systems are composed of a set of specialized entities communicating on behalf of a global application

The Essence of Distributed Systems Joel M. Crichlow, 2000 This text is intended to provide a concise introduction to Distributed systems as a first course or alternatively as a useful reference on an Operating systems or Networking course. This text presents the key issues pertinent to the design and construction of a distributed system in a logical manner. These issues include architecture, distributed resource management and accessing distributed resources.

PARALLEL AND DISTRIBUTED COMPUTING BASU, S. K., 2016-01-02 This concise text is designed to present the recent advances in parallel and distributed architectures and algorithms within an integrated framework. Beginning with an introduction to the basic concepts, the book goes on discussing the basic methods of parallelism, exploitation in computation through vector processing, super scalar and VLIW processing, array processing, associative processing, systolic algorithms and dataflow computation. After introducing interconnection networks, it discusses parallel algorithms for sorting, Fourier transform, matrix algebra and graph theory. The second part focuses on basics and selected theoretical issues of distributed processing. Architectures and algorithms have been dealt in an integrated way throughout the book. The last chapter focuses on the different paradigms and issues of high performance computing, making the reading more interesting. This book is meant for the senior level undergraduate and postgraduate students of computer science and engineering and information technology. The book is also useful for the postgraduate students of computer science and computer application.

Key features: Each chapter is explained with examples or example systems as the case may be to make the principles and methods involved easily understandable. Number of exercises are given at the end of each chapter for helping the reader to have better understanding of the topics covered. A large number of journal articles are highlighted to help the students interested in studying further in this field.
