Energy

Energy stores and transfers

- First, choose the start and end points; second, find the energy stores at those points; third, where you choose energy and which stores it is up.
- Electrical working
 - Heating of particles
 - Mechanical working
 - Heating of particles
- Example 1: A weightlifter lifting a weight transfers energy via mechanical working.
Example 2: A car engine transfers energy via heating by radiation.

Changes in energy stores

- 300 J/s
- 1.11 J
- Cyclist A's E_k is 3 times higher than the E_k for cyclist B. This is because their speed is 3 times that of cyclist B, and $2E \propto v^2$.

Energy changes in systems – specific heat capacity

- 44 500 J
- The thermal store will increase by 42 000 J as energy is conserved.
- 0

Power

- 35 000 W, because it transfers more energy per second to the water
- 1.1 J
- 3600 J

Energy transfers in a system

- Wear streamlined helmet and adjust body position to reduce air resistance; lubrication between seat's chain and gears to reduce heating effects of friction; high pressure in tyres to reduce E_k ; take area of contact between the road and the tyres.
- The infrared radiation from the heating elements in the boiler warms the water, raising its internal store; almost all this energy is transferred through heating by radiation to the fans.
- Less fuel consumption. Tyres, brakes and other components do not get worn out as quickly.

Efficiency

- Stops as it has changed within a system; neither energy is dissipated to the surroundings.
- Because the useful energy is transferred to the numerator of the fraction and the input energy is the denominator, since the useful energy transferred can never be greater than the input energy, the fraction can never return a value greater than 1.
- Being only 25% efficient means that four body modes of transfer (4 times more energy from the chemical store to do the mechanical work needed during climbing, e.g. to lift a weight).

Natural and global energy resources

- Renewable energy resources can be replaced; non-renewable but not renewable or rare resources cannot be replaced and so will eventually run out if we keep using them.
- Fossil fuels have high power output and are very reliable.
- Acceptance of all the following: Larger areas are needed to harness it; there is low power output; it has a low conversion efficiency; it can only be harnessed during daylight hours.

Review 33

- Renewable: wind waves, hydro, hydroelectric, bio, sun, geothermal, rain, air, etc.
Non-renewable: nuclear fuels, coal, oil, natural gas.
- Muscle energy = 0.5 = mass \times (speed)²
 $E_k = \frac{1}{2}mv^2$ $v = \sqrt{\frac{2E_k}{m}}$
 - elastic potential energy = 0.5 \times spring constant \times (extension)²
 $E_e = \frac{1}{2}kx^2$ $x = \sqrt{\frac{2E_e}{k}}$
 - $g \times h$ = mass \times gravitational field strength \times height
 $E_g = mgh$ $h = \frac{E_g}{mg}$
- It is a temperature difference, and degree Celsius and kelvin have the same magnitude, so using degrees Celsius or kelvin will affect the output of the calculator because the lining difference gives the same result. For example, the

temperature increase between 2°C and 20°C is $20 - 2 = 18^\circ\text{C}$, which expressed in kelvin would be $20 - 2 = 18^\circ\text{K}$.

- 1.1. Then gravity does work on it. As it comes it goes it's the same but the same height is less low. The work of energy transferred is higher for 1.1 B.
 - Energy transferred is $E_g = mgh$ and $h = \frac{E_g}{mg}$
 $h = \frac{0.5}{1.5 \times 9.8} = 0.034$

So, each floor is $\frac{0.34}{10} = 0.034$ m high.

- Aluminium has a higher thermal conductivity than plastic, so it will transfer energy by conduction to the surface at a higher rate than the plastic block so the top of the aluminium block will melt faster than the bottom of the plastic block.
- First we need to calculate the energy in the kinetic store when the car is at top speed.

$$E_k = \frac{1}{2}mv^2 = \frac{1}{2} \times 0.820 \times 0.27^2 = 0.030 \text{ J}$$

So, at top speed the car has 0.030 J in the kinetic store each second. This means a useful power output of 1.20 W. So, to find the efficiency of the toy car:

$$\begin{aligned} \text{Efficiency} &= \frac{\text{useful power output}}{\text{total power input}} \\ &= \frac{1.20}{1.7} = 0.71 \end{aligned}$$

We can multiply by 100 to find the percentage efficiency, i.e. 71%.

Electricity

Standard circuit diagram symbols

- Ammeters have polarity, voltmeters, but no meters have very high resistance.
- Their I-V characteristics are very similar and they both let current flow only in one direction. However, LEDs emit light, while diodes do not.
- A diode conducts with an I-V.

Electrical charge and current

- Atomic level current is the total of free or mechanical energy.
- Free electrons fill at the components of the circuit at the same time when the circuit is closed; so, when the circuit is closed all the free electrons will start or find
