Volkmar, Lisa A. Wiesner, 2009-08-17

Autism is in the public spotlight now more than ever as new research and information appears almost daily. Although in many ways this is a positive development it also presents challenges to families and practitioners who want to keep up with the latest developments and are left to sift through new information by themselves to see what is credible and relevant for them. Each of us needs a personal research assistant who can determine which information we need to pay attention to and let us know how it might affect our daily work and the children we are living with or serve. Since we each don't have our own research assistants on staff I am delighted to recommend this wonderful book by Fred Volkmar and Lisa Wiesner. Both of these talented professional leaders have combined their scientific skills and understanding of the field with great practical experience and ideas about how research can be translated into clinical practice. The result is a book that provides the best and most comprehensive information about recent scientific developments and a splendid practical guide for how they are being implemented and what we are learning in the process. The issues are presented in all of their complexity but translated into language that is clear, direct and easy to follow. The format also lends itself to understanding the complex issues and their implications through excellent charts, question and answer sections and chapters that vary from describing diagnostic issues to stating very specifically how to expand and evaluate the services one is receiving. The comprehensive references and lists of additional resources also add greatly to the overall package. As a professional dedicated to understanding scientific advances and helping families and teachers to utilize them most effectively I am very pleased to have an ally like this book available. I am very grateful to the authors for providing a very credible, practical and relevant addition to our field to help the many advocates and family practitioners to better understand the exciting new developments and how they can be implemented in our day to day work. Those taking the time to read through this superb volume will find it time well spent that pays back dividends in many different ways.

FOREWORD by Gary B. Mesibov, Ph.D., Professor and Director of TEACCH Treatment and Education of Autistic and Related Communication Handicapped Children, University of North Carolina at Chapel Hill.

Developmental Motor Disorders Deborah Dewey, David E. Tupper, 2004-09-21. Bringing together leading experts and providing vital insights to guide clinical practice, this is the first volume to comprehensively address childhood motor disorders from a neuropsychological perspective. The book explores the neural and behavioral bases of movement disorders and summarizes current findings from applied research. Existing approaches to assessment and neuroimaging are critically examined and new and innovative methods presented. Authors also synthesize the latest knowledge on motor difficulties associated with specific developmental and neurological problems: cerebral palsy, neuromuscular disease, autism, brain injury, disorders of coordination, speech and written language and more. Other important topics covered include psychosocial effects of motor skills impairments, frequently encountered comorbidities and the status of available intervention approaches.

Helping Low Birth Weight, Premature Babies Ruth T. Gross, Donna Spiker, Christine W. Haynes, 1997. Each year in the United States 250,000 infants are born too soon, weighing too little. For these low birth weight, premature

infants the future is uncertain since they are at risk for a variety of serious medical and developmental problems including behavioral and learning disorders that may have damaging effects for the rest of their lives The extent to which a comprehensive early intervention program could improve or prevent these adverse outcomes was examined in the Infant Health and Development Program a randomized controlled trial involving almost 1 000 infants in eight cities in the United States This book describes in detail the program its research methodology the progress of the program and the results of the clinical trial The program was administered by an interdisciplinary team composed of physicians biostatisticians child development specialists and researchers from several disciplines It was instituted upon the discharge of the infants from the neonatal nursery and was maintained for three years One third of the infants were randomly assigned to an intervention group the remainder to a follow up group Infants in both groups received pediatric care and community referral services but only those in the intervention group participated in a program that included extensive home visits attendance at a child development center and group meetings for parents The results of the program proved to be clinically important at age three the children in the intervention group had significantly higher IQ scores greater cognitive development and fewer behavioral problems The implications of the findings for public policy are equally important for there is increasing interest in the prevention early detection and management of developmental disabilities in children as evidenced by such legislation as the Education for All Children Act Strategies to minimize the problems of low birth weight children with their potential for long term savings through the prevention of disabilities and their attendant costs could have significant repercussions in such governmental areas as medical care education and social welfare *Assessment* John Salvia,James E.
