Bioconjugation Protocols Christof M. Niemeyer, 2008-02-04

There are a number of outstanding volumes that provide a comprehensive overview of bioconjugation techniques However many of the conventional approaches to the synthesis of chemically modified protein conjugates lack efficient means to control the stoichiometry of conjugation as well as the specific site of attachment of the conjugated moiety Moreover the recent developments in microarray technologies as well as in nanobiotechnology a novel field of research rapidly evolving at the crossroads of physics chemistry technology and materials science call for a summary of modern bioconjugation strategies to overcome the limitations of the classical approaches Bioconjugation Protocols Methods and Strategies is intended to provide an update of many of the classic techniques and also to introduce and summarize newer approaches that go beyond the pure biomedical applications of bioconjugation The purpose of Bioconjugation Protocols Methods and Strategies is therefore to provide instruction and inspiration for all those scientists confronting the challenges of semisynthesizing functional biomolecular reagents for a wide variety of applications ranging from novel biomedical diagnostics to therapeutics to biomaterials Part I contains seven protocols for the preparation of protein conjugates

Oxidative Stress Biomarkers and Antioxidant Protocols Donald Armstrong, 2008-02-04

The first protocols book Free Radical and Antioxidant Protocols 1 was published in late 1998 Sections were divided into three parts covering selected biochemical techniques for measuring oxidative stress antioxidant AOX activity and combined applications In choosing the 40 methods to be included in that book I realized there were considerably more of equal value than that which we could have presented in a single volume To produce a comprehensive resource this book and a third are being compiled to expand coverage of the field A summary of papers 2 published on this important subject emphasizes the continuing rapid growth in oxidative stress investigations relating to our understanding of biochemical reactions their relevance to pathophysiological mechanisms how disease may arise and how therapeutic intervention may be achieved 3 Although there is some overlap between the categories the analysis shown below illustrates

where current studies are concentrated and are almost evenly distributed between free radicals and AOX Over the last 4 yr there has been a 55% increase in the number of papers published in the area

[Handbook of Sample Preparation for Scanning Electron Microscopy and X-Ray Microanalysis](#) Patrick Echlin,2011-04-14 Scanning electron microscopy SEM and x ray microanalysis can produce magnified images and in situ chemical information from virtually any type of specimen The two instruments generally operate in a high vacuum and a very dry environment in order to produce the high energy beam of

electrons needed for imaging and analysis With a few notable exceptions most specimens destined for study in the SEM are poor conductors and composed of beam sensitive light elements containing variable amounts of water In the SEM the imaging system depends on the specimen being sufficiently electrically conductive to ensure that the bulk of the incoming electrons go to ground The formation of the image depends on collecting the different signals that are scattered as a consequence of the high energy beam interacting with the sample Backscattered electrons and secondary electrons are generated within the primary beam sample interactive volume and are the two principal signals used to form images The backscattered electron coefficient increases with increasing atomic number of the specimen whereas the secondary electron coefficient is relatively insensitive to atomic number This fundamental difference in the two signals can have an important effect on the way samples may need to be prepared The analytical system depends on collecting the x ray photons that are generated within the sample as a consequence of interaction with the same high energy beam of primary electrons used to produce images

from conifers and diploid tissues Appendices outline extraction electrode and gel buffers and enzyme staining recipes

Antibody Engineering Benny K. C. Lo, 2008-02-03 The exquisite binding specificity of antibodies has made them valuable tools from the laboratory to the clinic Since the description of the murine hybridoma technology by Kohler and Milstein in 1975 a phenomenal number of monoclonal antibodies have been generated against a diverse array of targets Some of these have become indispensable reagents in biomedical research while others were developed for novel therapeutic applications The attractiveness of antibodies in this regard is obvious high target specificity adaptability to a wide range of disease states and the potential ability to direct the host's immune system for a therapeutic response The initial excitement in finding Paul Ehrlich's magic bullet however was met with widespread disappointment when it was demonstrated that murine antibodies frequently elicit the human anti-murine antibody (HAMA) response thus rendering them ineffective and potentially unsafe in humans Despite this setback advances in recombinant DNA techniques over the last 15-20 years have empowered the engineering of recombinant antibodies with desired characteristics including properties to avoid HAMA The ability to produce bulk quantities of recombinant proteins from bacterial fermentation also fueled the design of numerous creative antibody constructs To date the United States Food and Drug Administration has approved more than 10 recombinant antibodies for human use and hundreds more are in the development pipeline The recent explosion in genomic and proteomic information appears ready to deliver many more disease targets amenable to antibody-based therapy
