

Introduction to Biofertilizer

Biofertilizers are natural and sustainable products that contain living microorganisms that enhance plant growth and soil health. These microorganisms can fix atmospheric nitrogen, solubilize phosphorus, produce plant growth-promoting substances, and enhance the soil structure and fertility.

Biofertilizers are different from chemical fertilizers, which are made from synthetic materials and can have harmful effects on the environment and human health. Biofertilizers, on the other hand, are environmentally friendly and do not leave toxic residues in the soil.

Biofertilizers are classified into three categories: nitrogen-fixing biofertilizers, phosphorus-solubilizing biofertilizers, and plant growth-promoting biofertilizers.

Nitrogen-fixing biofertilizers contain bacteria that can convert atmospheric nitrogen into a form that plants can use. These bacteria are commonly found in legumes such as beans, peas, and soybeans.

Rhizobium, Azotobacter, and Azospirillum are some examples of nitrogen-fixing bacteria that are commonly used as biofertilizers.

Phosphorus-solubilizing biofertilizers contain microorganisms that can break down insoluble

Phyconanotechnology: Current Research, Challenges, and Prospects Lakhan Kumar, Navneeta Bharadvaja, Sunil Khare, Raksha Anand, 2025-06-13 This book explores the scientific development in the field of algal based nanomaterials synthesis, production methods and commercial and utilization aspects of phyconanomaterials to address a range of problems of humanity. Nanomaterials have been recently explored for and employed in environmental remediation, biomedical applications, agriculture, food industries, energy sectors, cosmetics, biolabeling and space due to their versatility and wide range of applicability owing to their peculiar material characteristics and other attributes. Their conventional synthesis approaches are replacing green methods as the latter is comparatively economical, energy efficient and eco friendly. Biological entities and derived materials based nanomaterials synthesis is such a green approach. Using natural systems to synthesize nanomaterials does not leave behind any toxic compounds generally produced as by products when physical or chemical methods are employed. Phyconanotechnology, a green way of synthesizing nanomaterials, can be used to overcome this issue. In the proposed book, algal diversity based nanomaterials synthesis and their applications will be presented to the readers.

Biofertilizers Technology S. Kannaiyan, K. Kumar, K. Govindarajan, 2010-04-01 Rice based cropping system is the major cropping system practised in India which includes the rotation of crops involving rice, pulses, oil seeds, cotton, sugar cane, green manures etc. The rice based cropping system offers lot of scope for the effective utilization of a wide range of biofertilizers such as Azolla, BGA, Azospirillum, Rhizobium, Gluconacetobacter diazotrophicus and other heterotrophic N₂ fixing bacteria which help to increase the yield by reducing the cost of cultivation. It thus has dual advantages of being sustainable without endangering the environment and being highly cost effective. This book, *Biofertilizer Technology for Rice Based Cropping System*, deals with the current developments in the basic and applied aspects of biofertilizers used in the rice based cropping, including the novel endophytic diazotrophs viz. Azorhizobium caulinodans, Gluconacetobacter diazotrophicus, Pink Pigmented Facultative Methylophiles (PPFM) etc. The role of P, Zn and Si solubilizers in the nutrient dynamics of the rice ecosystem has also been covered.
