How We Teach Science John L. Rudolph, 2019-06-01 A former Wisconsin high school science teacher makes the case that how and why we teach science matters especially now that its legitimacy is under attack Why teach science The answer to that question will determine how it is taught Yet despite the enduring belief in this country that science should be taught there has been no enduring consensus about how or why This is especially true when it comes to teaching scientific process Nearly all of the basic knowledge we have about the world is rock solid The science we teach in high schools in particular laws of motion the structure of the atom cell division DNA replication the universal speed limit of light is accepted as the way nature works Everyone also agrees that students and the public more generally should understand the methods used to gain this knowledge But what exactly is the scientific method Ever since the late 1800s scientists and science educators have grappled with that question Through the years they've advanced an assortment of strategies ranging from the laboratory method to the five step method to science as inquiry to no method at all *How We Teach Science* reveals that each strategy was influenced by the intellectual cultural and political circumstances of the time In some eras learning about experimentation and scientific inquiry was seen to contribute to an individual's intellectual and moral improvement while in others it was viewed as a way to minimize public interference in institutional science John Rudolph shows that how we think about and teach science will either sustain or thwart future innovation and ultimately determine how science is perceived and received by the public

evaluation social work and education policy and politics **Breaking Point** Rebecca Schwartz Greene, 2023-01-03 WINNER SOCIETY FOR MILITARY HISTORY DISTINGUISHED BOOK AWARDS FIRST BOOK This book informs the public for the first time about the impact of American psychiatry on soldiers during World War II Breaking Point is the first in depth history of American psychiatry in World War II Drawn from unpublished primary documents oral histories and the author's personal interviews and correspondence over years with key psychiatric and military policymakers it begins with Franklin Roosevelt's endorsement of a universal Selective Service psychiatric examination followed by Army and Navy pre and post induction examinations Ultimately 2.5 million men and women were rejected or discharged from military service on neuropsychiatric grounds Never before or since has the United States engaged in such a program In designing Selective Service Medical Circular No 1 psychiatrist Harry Stack Sullivan assumed psychiatrists could predict who might break down or falter in military service or even in civilian life thereafter While many American and European psychiatrists questioned this belief and huge numbers of American psychiatric casualties soon raised questions about screening's validity psychiatric and military leaders persisted in 1942 and 1943 in endorsing ever tougher screening and little else Soon families complained of fathers and teens being drafted instead of being identified as psychiatric 4Fs and Blacks and Native Americans among others complained of bias A frustrated General George S Patton famously slapped two malingering neuropsychiatric patients in Sicily a sentiment shared by Marshall and Eisenhower though they favored a tamer style Yet psychiatric rejections evacuations and discharges mounted While psychiatrist Roy Grinker and a few others treated soldiers close to the front in Tunisia in early 1943 this was the exception But as demand for manpower soared and psychiatrists finally went to the field and saw that combat itself not predisposition precipitated breakdown leading military psychiatrists switched their emphasis from screening to prevention and treatment But this switch was too little too late and slowed by a year long series of Inspector General investigations even while numbers of psychiatric casualties soared Ironically despite and even partly because of psychiatrists wartime performance plus the emotional toll of war postwar America soon witnessed a dramatic growth in numbers popularity and influence of the profession culminating in the National Mental Health Act 1946 But veterans with PTSD not recognized until 1980 were largely neglected Congressional Record United States.

Congress, 2017-11 *How Humans Recognize Objects: Segmentation, Categorization and Individual Identification* Chris Fields, 2016-08-18 Human beings experience a world of objects bounded entities that occupy space and persist through time Our actions are directed toward objects and our language describes objects We categorize objects into kinds that have different typical properties and behaviors We regard some kinds of objects each other for example as animate agents capable of independent experience and action while we regard other kinds of objects as inert We re-identify objects immediately and without conscious deliberation after days or even years of non observation and often following changes in the features locations or contexts of the objects being re-identified Comparative developmental and adult observations using a variety of

approaches and methods have yielded a detailed understanding of object detection and recognition by the visual system and an advancing understanding of haptic and auditory information processing Many fundamental questions however remain unanswered What for example physically constitutes an object How do specific classically characterizable object boundaries emerge from the physical dynamics described by quantum theory and can this emergence process be described independently of any assumptions regarding the perceptual capabilities of observers How are visual motion and feature information combined to create object information How are the object trajectories that indicate persistence to human observers implemented and how are these trajectory representations bound to feature representations How for example are point light walkers recognized as single objects How are conflicts between trajectory driven and feature driven identifications of objects resolved for example in multiple object tracking situations Are there separate what and where processing streams for haptic and auditory perception Are there haptic and or auditory equivalents of the visual object file Are there equivalents of the visual object token How are object identification conflicts between different perceptual systems resolved Is the common assumption that persistent object is a fundamental innate category justified How does the ability to identify and categorize objects relate to the ability to name and describe them using language How are features that an individual object had in the past but does not have currently represented How are categorical constraints on how objects move or act represented and how do such constraints influence categorization and the re identification of individuals How do human beings re identify objects including each other as persistent individuals across changes in location context and features even after gaps in observation lasting months or years How do human capabilities for object categorization and re identification over time relate to those of other species and how do human infants develop these capabilities What can modeling approaches such as cognitive robotics tell us about the answers to these questions Primary research reports reviews and hypothesis and theory papers addressing questions relevant to the understanding of perceptual object segmentation categorization and individual identification at any scale and from any experimental or modeling perspective are solicited for this Research Topic Papers that review particular sets of issues from multiple disciplinary perspectives or that advance integrative hypotheses or models that take data from multiple experimental approaches into account are especially encouraged
