Conceptual Questions

13.1. An electrified rod attracts pieces of paper. After a while these pieces fly away! Why?

Suppose a glass rod is rubbed with silk, it becomes positively charged (an electrified rod). When this glass rod is brought close to the pieces of paper, by electrostatic induction, a negative charge appears on pieces of paper due to which these pieces of paper attracted towards the rod. But when these pieces of paper touch the charged rod, some of electrons from the pieces of paper are transferred to the glass rod and then pieces of paper also become positively charged, due to which there will be the force of repulsion between rod and pieces of paper, hence the pieces of paper fly away from the rod.

13.2.- How much negative charge has been removed from a positively charged electroscope if it has a charge of $7.5 \times 10^{-13} \text{ C}$?

$7.5 \times 10^{-13} \text{ C}$ of negative charge has been removed from an electroscope to produce a positive charge of $7.5 \times 10^{-13} \text{ C}$ on the electroscope.

13.3. In what direction will a positively charged particle move in an electric field?

In an electric field positively charged particle will move from a point of higher potential to a point of lower potential i.e., the positively charged particle will move in the direction of electric field.

13.4. Does each capacitor carry equal charge in series combination? Explain.

Yes, each capacitor carries equal charge in series combination. When capacitors are connected in series, the same amount of charge flows through each capacitor. This is because the capacitors are connected in a single loop, and the charge that flows out of one capacitor must flow into the next capacitor.

In a series combination of capacitors, the total capacitance is less than the capacitance of any individual capacitor. This is because the capacitors are connected in a single loop, and the charge that flows out of one capacitor must flow into the next capacitor. The total capacitance is the reciprocal of the sum of the reciprocals of the individual capacitances.

acknowledged **Modern Take On Physics, A - Volume 2: Classical And Quantum Field Theory** Giovanni Organtini, Graziano Surace, 2025-03-17 These two volumes cover the classical topics typically taught in undergraduate physics courses and beyond. However, we teach classical physics using a very different language from traditional books influenced by the language of modern physics in a move to encourage a positive approach towards the latter subject. Based around the unifying concept of energy, we take a distinct approach to the organisation of material, presenting physics in a cohesive manner without separating topics such as mechanics, kinematics, thermodynamics, electricity and magnetism. Instead, physics is revealed gradually, emphasising a holistic approach to science. Despite this peculiarity, we have maintained the conventional separation between Physics I and II to assist teachers in smoothly integrating these books into their courses. These innovative volumes present valuable new perspectives. Although their approach is bold, they will certainly prompt interesting reflections on traditional teachings. A significant portion of this second volume is committed to modern physics, including an introduction to the standard model of fundamental interactions. The old quantum mechanics is largely excluded in favour of quantum field theory, which we present in a manner accessible to undergraduate students.

Physics Education research is a young field with a strong tradition in many countries However it has only recently received full recognition of its specificity and relevance for the growth and improvement of the culture of Physics in contemporary Society for different levels and populations This may be due on one side to the fact that teaching therefore education is part of the job of university researchers and it has often been implicitly assumed that the competences required for good research activity also guarantee good teaching practice On the other side and perhaps more important is the fact that the problems to be afforded in doing research in education are complex problems that require a knowledge base not restricted to the disciplinary physics knowledge but enlarged to include cognitive science communication science history and philosophy The topics discussed here look at some of the facets of the problem by considering the interplay of the development of cognitive models for learning Physics with some reflections on the Physics contents for contemporary and future society with the analysis of teaching strategies and the role of experiments the issue of assessment and cultural aspects Information is also given on the organizations involved in connecting various aspects of Physics Education the International Commission on Physics Education the European Physical Society and the European Physics Education Network **Teaching Physics**
