### CIRCUIT NOTES

The circuit diagram enclosed applies to all models from and including serial number 2880. All channels prior to this do not include R22, and the pole labelled v.h.f. on S15 is connected to tag 16 on the i.f. amplifier module. The common pole is connected to tag 14.

If a fault develops in either the i.f. amplifier or v.h.f. mixer modules the manufacturers advise that the complete unit should be carefully removed and returned to them for replacement or repair.

### CIRCUIT ALIGNMENT

**Equipment Required.**—A signal generator covering the range 100kc/s-20Mc/s, 10 per cent amplitude modulated, and an i.m. output (100kc/s deviation) at 100Mc/s; an audio output meter of 50 impedance to be used in place of the loudspeaker, alternatively an a.c. voltmeter switched to the 2.5V a.c. range connected in parallel with the loudspeaker, and an r.f. coupling coil.

During alignment the input signal should not be allowed to exceed the level required to provide an audio output of not greater than 50mW in order to prevent a.g.c. action masking the alignment peaks.

**Note:** No alignment instructions are given for the i.f. transformers, and no attempt should be made to realign them.

1.—Switch on signal generator and allow 15 minutes to warm up. Connect in appropriate manner the output meter to be used.

Rotate tuning control fully anti-clockwise, and check that cursor coincides with the low frequency end of tuning scale.

Connect the r.f. coupling coil to the signal generator output; all signals are to be fed in via this coil in order to avoid disturbance to the r.f. oscillator circuits.

2.—Switch receiver to m.w., and tune to the 200m calibration mark. Loosely couple the r.f. coupling coil to ferrite rod aerial, and feed in a 1,500kc/s a.m. signal. Adjust a.m. oscillator and aerial trimmers for maximum output.

3.—Tune receiver to the 500m calibration mark and feed in 500kc/s a.m. signal. Adjust a.m. oscillator coil core, and I.2 (slide along ferrite rod) for maximum output.

4.—Repeat operations 2 and 3 for optimum results finishing with 3.

5.—Switch receiver to l.w. and tune to the 100m calibration mark. Feed in a 20kc/s a.m. signal, and adjust CV1 and CV2 for maximum output.

6.—Tune receiver to the 516m calibration mark and feed in a 158kc/s a.m. signal. Adjust I.3 (slide along ferrite rod) for maximum output.

7.—Repeat operations 5 and 6 for optimum results finishing with 5.

8.—Switch receiver to v.h.f.; switch off a.f.c. (spring button depressed); rotate tuning control fully clockwise, and loosely couple the r.f. coupling coil to the telescopic aerial.

9.—Feed in a 100Mc/s f.m. signal. Adjust f.m. oscillator and f.m. r.f. trimmers for maximum output.

**Audio Adjustments.** All the following adjustments are carried out with 9V measured across C14.

Connect a voltmeter switched to a suitable range between junction of TR5 and TR6 emitter and positive supply, and with volume control at minimum adjust RV2 to produce a reading of 4.7V on the meter.

Connect a milliammeter in black flex link (LINK) on left side of printed panel, and adjust RV3 to give an average stage quiescent current of 5.5mA at 50 deg C. Allow one minute then recheck this figure. Remove meter and reconnect link.

Connect an oscilloscope to the output across a 50 load, and turn volume control to maximum.

Apply an audio signal to the top of the volume control and increase the input until clipping is apparent.

Adjust RV2 for symmetry at onset of clipping.

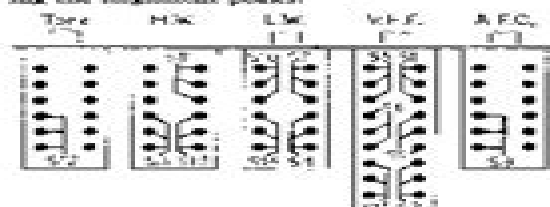

### DISMANTLING

To remove the chassis from the case, first remove the base cover by inserting a finger in the hole provided, and pulling the cover to one side (see fig. 1) when sufficient clearance with the side flange has been achieved.

Remove the battery, and unsolder the leads from the loudspeaker.

Unscrew and remove two screws securing chassis to case from each side, and one screw retaining telescopic aerial.

The complete chassis may now be removed from the top of the case.
