Momentum

Momentum is a measure of how hard it is to stop something

$$p = mv$$

In any collision total momentum is constant provided no external forces act.

There are two types of collision; elastic and inelastic. In an elastic collision kinetic energy is conserved, in an inelastic collision kinetic energy is not conserved.

Force is the rate of change of momentum.

$$F = \frac{\Delta(mv)}{\Delta t}$$

The change in momentum is demonstrated as the area under a force-time graph.

Circular Motion

Linear velocity is the speed an object moves in a straight line and is given by:

$$v = 2\pi rf \text{ or } v = \frac{2\pi r}{t}$$

Angular speed is the angle an object rotates through per second and is given by:

$$\omega = 2\pi f \text{ or } \omega = \frac{2\pi}{t}$$

By combining the above equations we can see that linear speed and angular speed are linked by the equation $v = r\omega$

For an object to move at a constant speed in a circular path there needs to be a centripetal force (The force which acts towards the centre of the circle). The centripetal force is given by the equation:

$$F = \frac{mv^2}{r}$$

The body is also undergoing constant acceleration because velocity changes with direction and the body is constantly changing direction. Centripetal acceleration is given by the equations

$$a = \frac{v^2}{r} \text{ or } a = \omega^2 r$$
