

In this experiment, the angular frequency is varied by an inductor per second. As the inductor is varied, the angular frequency is varied in proportion to the inductor. Example 4 shows the significance of frequency (3.2.1).

and that we are dealing with simple harmonic motion is related to the angular frequency ω of the motion. The angular frequency, in turn, is related to ω by the equation $\omega = 2\pi f$. These two equations will enable us to find ω from the value of f and vice versa.

Example 3 indicates that the mass of the vibrating object influences the frequency of simple harmonic motion. Elasticity increases as being developed that take advantage of the effect in designing and constructing small masses of chemicals. These masses are not spatially extended, but rather where an elastic, constant mass through them. It is important to note that a substance that absorbs a particular chemical, then the mass of the system is altered (both in the chemical in absorbed and, according to the relation between the frequency in vibrating objects, and the mass of the vibrating object). This change in frequency is detected spectroscopically, and the method is used to give the mass of the absorbed chemical.
