Disassembler Yabin Meng, 2007 Current database workloads often consist of a mixture of short online transaction processing OLTP queries and large complex queries such as those typical of online analytical processing OLAP OLAP queries usually involve multiple joins arithmetic operations nested sub queries and other system or user defined functions and they typically operate on large data sets These resource intensive queries can monopolize the database system resources and negatively impact the performance of smaller possibly more important queries In this thesis we present an approach to managing the execution of large queries that involves the decomposition of large queries into an equivalent set of smaller queries and then scheduling the smaller queries so that the work is accomplished with less impact on other queries We describe a prototype implementation of our approach for IBM DB2 trade mark and present a set of experiments to evaluate the effectiveness of the approach
