Reflection/Transmission

1. a. In the box below, draw the pulse as it returns after reflecting from a fixed end.

- b. Draw the pulse as it returns after reflecting from a free end.

2. a. Draw the pulse as it returns after reflecting from a fixed end.

- b. Draw the pulse as it returns after reflecting from a free end.

3. The diagram to the right shows a pulse traveling from a "light" string to a "heavy" string. In the box below, draw the reflected and transmitted pulses after the original pulse has reached point P.

4. The diagram to the right shows a pulse traveling from a "heavy" string to a "light" string. Draw the reflected and transmitted pulses after the original pulse has reached point P.

You need to decide how picky you want to be. You may only wish to emphasize the phase of the pulse. You may also want to include size and/or speed. The pulse will be faster in the lighter string, and will also be larger if the pulse is going from heavy to light.

5. Below is a pulse in a light rope approaching a heavy rope. Sketch the two rope system just after the pulse hits the wall.

6. To the right is a two-rope system soon after a pulse arrived at the center.

- a) If the right rope is the heavy rope, what did the system look like just after the system was shaken? In other words, show with a sketch which end was shaken and if the shake was up or down.

- b) If the left rope is the heavy rope, what did the system look like just after the system was shaken?

7. On the lines below draw the pulses as they would appear after they have completed their reflection from the end. Slanted lines, (/ /), following the barrier line represent a fixed end.

Ages 8-10 Rosemary Morris, 2003 *Introduction to the Thermodynamically Constrained Averaging Theory for Porous Medium Systems* William G. Gray, Cass T. Miller, 2014-02-19 Thermodynamically constrained averaging theory provides a consistent method for upscaling conservation and thermodynamic equations for application in the study of porous medium systems. The method provides dynamic equations for phases, interfaces and common curves that are closely based on insights from the entropy inequality. All larger scale variables in the equations are explicitly defined in terms of their microscale precursors, facilitating the determination of important parameters and macroscale state equations based on microscale experimental and computational analysis. The method requires that all assumptions that lead to a particular equation form be explicitly indicated, a restriction which is useful in ascertaining the range of applicability of a model as well as potential sources of error and opportunities to improve the analysis.

Dynamic Modeling and Neural Network-Based Intelligent Control of Flexible Systems Hejia Gao, Wei He, Changyin Sun, 2025-01-03 Comprehensive treatment of several representative flexible systems ranging from dynamic modeling and intelligent control design through to stability analysis. Fully illustrated throughout. *Dynamic Modeling and Neural Network Based Intelligent Control of Flexible Systems* proposes high efficiency modeling methods and novel intelligent control strategies for several representative flexible systems developed by means of neural networks. It discusses tracking control of multi link flexible manipulators, vibration control of flexible buildings under natural disasters and fault tolerant control of bionic flexible flapping wing aircraft and addresses common challenges like external disturbances, dynamic uncertainties, output constraints and actuator faults. Expanding on its theoretical deliberations, the book includes many case studies demonstrating how the proposed approaches work in practice. Experimental investigations are carried out on Quanser Rotary Flexible Link, Quanser 2 DOF Serial Flexible Link, Quanser Active Mass Damper and Quanser Smart Structure platforms. The book starts by providing an overview of dynamic modeling and intelligent control of flexible systems, introducing several important issues along with modeling and control methods of three typical flexible systems. Other topics include Foundational mathematical preliminaries including the Hamilton principle, model discretization methods, Lagrange's equation method and Lyapunov's stability theorem. Dynamic modeling of a single link flexible robotic manipulator and vibration control design for a string with the boundary time varying output constraint. Unknown time varying disturbances such as earthquakes and strong winds and how to suppress them and use MATLAB and Quanser to verify effectiveness of a proposed control. Adaptive vibration control methods for a single floor building like structure equipped with an active mass damper (AMD). *Dynamic Modeling and Neural Network Based Intelligent Control of Flexible Systems* is an invaluable resource for researchers and engineers seeking high efficiency modeling methods and neural network based control solutions for flexible systems along with industry engineers and researchers who are interested in control theory and applications and students in related programs of study.

Modeling and Analysis for Optimal Scheduling of Biodiesel Batch-Plants Mohamad Fauzan Amir, 2011 Generally scheduling problems accompanying typical batch processes are vitally important to be solved for improving the plant productivity In these respects finding a good and feasible schedule or even an optimal result by which costs and lead times can be reduced is often a very complex and also a difficult task Moreover in large plants the challenges come not only from the modeling ways that require systematic and structured approaches but also from the exact strategies how the performance of the model can be analyzed The goal of this research is to develop a comprehensive study on industrial sized plants with regard modeling and analysis of scheduling problems Formalization of the required plant specifications the modularly modeling ways which refer to the widely used batch standards and also the strategies for tackling complexity are the main contributions of this thesis These studies will be carried out by using the Timed Net Condition Event Systems TNCEs model Finally the model is analyzed to synthesize an optimal control strategy for the investigated plants
