Multimedia Modeling, Modeling Multimedia Information And Systems - Proceedings Of The First International Workshop Ahmed Karmouch, 1999-09-24 Multimedia systems result from the merging of the computing communications and broadcasting industries This merging has been made possible today by the technical advances in high speed broadband networks computer desktop workstations and information storage and compression techniques Currently text and image are the predominant forms of information exchanged over the Internet However there are clear signs that the situation is rapidly changing with the recent emergence of multimedia applications in the area of education business e commerce and entertainment resulting therefore in increased consumption of network bandwidth and in the creation of a very large volume of information that needs to be processed and stored This trend has made strong demands on the multimedia modeling research community to develop new semantic models that will further facilitate the creation representation manipulation and animation of multimedia content with a better level of granularity than what is possible to achieve with today s multimedia

information systems This volume explores issues associated with multimedia modeling information and systems and presents the current status of work in this field It covers a broad range of theoretical conceptual and practical topics and addresses the needs of a wide audience including researchers multimedia systems designers and users of multimedia systems

Mitochondria in Skeletal Muscle Health, Aging and Diseases Gilles Gouspillou, Russell T.

Hepple,2017-02-09 Skeletal muscle is the most abundant tissue of the human body making up to 40 to 50% of the human body mass While the importance of optimal muscle function is well recognized in the athletic field its significance for general health is often underappreciated In fact the evidence that muscle mass strength and metabolism are essential for our overall health is overwhelming As the largest protein reservoir in the human body muscles are essential in the acute response to critical illness such as sepsis advanced cancer and traumatic injury Loss of skeletal muscle mass has also been associated with weakness fatigue insulin resistance falls fractures frailty disability several chronic diseases and death As a consequence maintaining skeletal muscle mass strength and metabolism throughout the lifespan is critical to the maintenance of whole body health Mitochondria are fascinating organelles regulating many critical cellular processes for skeletal muscle physiology including for instance energy supply reactive oxygen species production calcium homeostasis and the regulation of apoptosis It is therefore not surprising that mitochondrial dysfunction has been implicated in a large number of adverse events conditions and pathologies affecting skeletal muscle health While the importance of normal mitochondrial function is well recognized for muscle physiology there are important aspects of mitochondrial biology that are still poorly understood These include mitochondrial dynamics fusion and fission processes morphology and processes involved in mitochondrial quality control mitophagy Defining the mechanisms regulating these different aspects of mitochondrial biology their importance for muscle physiology as well as the interrelations will be critical for expanding understanding of the role played by mitochondria in skeletal muscle physiology and health The present research topic provides readers with novel experimental approaches knowledge hypotheses and findings related to all aspects of mitochondrial biology in healthy and diseased muscle cells
