

DNA Replication

Read the article DNA Polymerase – Keeping you cloned then annotate the diagram below showing the process of DNA replication.

Complete the following using the most appropriate words:

DNA replication involves the separation of the two _____ chains that make up the molecule. Firstly the double helix is opened up by an enzyme called _____. The points where the helix splits are called _____. To allow the helix to untwist without causing a tangled mess, one chain is broken by an enzyme called _____. One new strand of DNA is made by the enzyme known as _____ in a continuous process. On the other strand the enzyme works in the opposite direction making small sections of _____ DNA simultaneously. The sections are then joined together by the enzyme _____. Any incorrect paired bases are removed using the enzyme _____. As the new DNA contains half of the original DNA, the process is known as _____ replication.

Inducible Gene Expression, Volume 1 P.A. Baeuerle, 1994-12-22 Cells have evolved multiple strategies to adapt the composition and quality of their protein equipment to needs imposed by changes in intra and extracellular conditions The appearance of proteins transmitting novel functional properties to cells can be controlled at a transcriptional posttranscriptional translational or posttranslational level Extensive research over the past 15 years has shown that transcriptional regulation is used as the predominant strategy to control the production of new proteins in response to extracellular stimuli At the level of gene transcription the initiation of mRNA synthesis is used most frequently to govern gene expression The key elements controlling transcription initiation in eukaryotes are activator proteins transactivators that bind

in a sequence specific manner to short DNA sequences in the of genes The activator binding sites are elements of larger proximity control units called promoters and enhancers which bind many distinct proteins These may synergize or negatively cooperate with the activators The do novo binding of an activator to DNA or if already bound to DNA its functional activation is what ultimately turns on a high level expression of genes The activity of transactivators is controlled by signalling pathways and in some cases transactivators actively participate in signal transduction by moving from the cytoplasm into the nucleus In this first volume of Inducible Gene Expression leading scientists in the field review six eukaryotic transactivators that allow cells to respond to various extracellular stimuli by the expression of new proteins Modern Biology Towle,Albert Towle,1991 Teacher's Guide to the Modern Biology Program James Howard Otto,Albert Towle,Elizabeth H.
