OBJECTIVE: How do water molecules move in and out of cells?

Why?

Water accounts for over 70% of the human body. If water levels are not regulated and maintained in an organism the consequences can be disastrous. Cells and tissues may swell, blood cells burst, or the brain may expand so much it pushes on the skull, leading to brain damage and death. So what exactly is the process that allows organisms to regulate and maintain their water content?

Model 1 – Movement of Water In and Out of Cells

1-A solution consists of solute and solvent mixed together. IDENTIFY the solute and solvent and their symbols in Model 1.

solute: _____ / _____

solvent: _____ / _____

2-CONSIDER the size of the sugar molecule and water molecule in Model 1. Which molecules are able to move through the cell membrane? _____

3-COUNT the molecules in model 1 and complete the table below.

	Inside the Cell	Outside the Cell
Number of sugar molecules		
Number of water molecules		
Ratio of water to sugar		

4-DETERMINE which solutions are more concentrated in Model 1—inside or outside the cell.

EXPLAIN in terms of ratio of solute to solvent particles.

Transport Edward D. Korn, 2013-03-09 One property common to all cells is transport Molecules and ions must enter and leave cells by crossing membranes in a controlled manner The process may take any of several forms simple diffusion carrier mediated diffusion active transport or group translocation There is more than one way to measure each Transport kinetics with particular reference to the red blood cell were discussed in a previous volume Three chapters deal with the general subject of transport in this volume Maloney Kashket and Wilson summarize the appropriate methodology for studying metabolite and ion transport in bacteria and Kimmich describes the relevant methodology for the isolated intestinal epithelial cell The methods described in these two chapters have general application to transport studies in single cells from any source The approach described in these two complementary articles is extended in the chapter by Hochstadt and her collaborators on the use of isolated membranes from bacterial and mammalian cells for the study of transport phenomena If one can prepare a suitable plasma membrane fraction sealed impermeable vesicles with the necessary transport components intact it becomes possible to separate the events of transport from any subsequent metabolism that may occur in the cell Isolated membrane vesicles are relatively easy to obtain from bacteria and they are comparatively well studied Work with similar preparations from cultured mammalian cells is just beginning but has much promise

Intracellular Transport Katherine Brehme Warren, 2012-12-02 Intracellular Transport Volume 5 brings together a seemingly disparate group of scientists who offer their perspectives on the processes of and mechanisms underlying intracellular transport Organized into 14 chapters this volume begins with a review of some of the viewpoints about membrane structure and the unit membrane concept including the so called paucimolecular theory of cell membrane structure advanced by Danielli and Davson The next chapters focus on intracellular potentials the localization of adenine nucleoside phosphatase activity pinocytosis in amoeba the brush border of cells and the transport of gamma aminobutyric acid The reader is also introduced to pattern and rhythm diffusion and reaction coupling compartmental analysis and residence time distributions and parametric pumping The remaining chapters explore intracellular transport fluxes theoretical aspects of permeability transport rotating helices and contractile mechanisms and
