Alarm Details

Description

VM snapshot (esxhost0200) size (34.4%) is above a defined threshold (28.2%). Current size is 8.2% (28)

Knowledge

The VM has been running on a snapshot for extended period of time, which exceeded the configured threshold for the snapshot file size.

A snapshot preserves the state and data of a VM at a specific point in time, and is typically used for backup or maintenance activities (such as patching).

Causes

A VM provides several operations for creating and managing snapshots and snapshot chains. These operations let you create snapshots, revert to any snapshot in the chain, and remove snapshots. You can create extensive snapshot trees that you can use to save VM state at any point in time, and restore it later, if necessary. It is common that users forget to remove snapshot when it is no longer needed.

Additional, 3rd party software (such as backup software) can automatically create snapshots for the purpose of full backup. Sometimes, such software may be unable to automatically remove the snapshot due to identification problems or vCenter Server communication issues, leaving the snapshot behind.

If a VM is running off of a snapshot, it is storing all disk changes to a child disk. The more changes are made to the VM disks, the larger the snapshot file grows. Snapshot file size can never exceed the size of original VM disk though.
