## **Somebody Wanted But So Then Predictions:**

**Understanding and Prediction** S. Nowak, 2012-12-06 One of the more characteristic features of contemporary sociology is an increasing interest in theories. More and more theories are being developed in various areas of social investigation; we observe also an increasing number of verificational studies aimed primarily toward the verification of various theories. The essays presented in this volume deal with theories too, but they approach this problem from a methodological perspective. Therefore it seems worthwhile in the preface to this volume to make a kind of general declaration about the author's aims and his approach to the subject of his interest and about his view of the role of methodological reflection in the development of sciences. First let me say what methodology cannot do. It cannot be a substitute for the formulation of substantive theories, nor can it substitute for the empirical studies which confirm or reject such theories. Therefore its impact upon the development of any science, including the social sciences, is only indirect, by its undertaking the analysis of research tools and rules of scientific procedures. It can also propose certain standards for scientific procedures, but the application of these standards is the domain of substantive researchers, and it is the substantive researchers who ultimately develop any science. Nevertheless the potential impact of methodological reflection, even if only indirect, should not be underestimated.

**Predictions in the Brain** Moshe Bar, 2011-05-10 When one is immersed in the fascinating world of neuroscience findings, the brain might start to seem like a collection of modules, each specializing in a specific mental feat. But just like in other domains of Nature, it is possible that much of the brain and mind's operation can be explained with a small set of universal principles. Given exciting recent developments in theory, empirical findings, and computational studies, it seems that the generation of predictions might be one strong candidate for such a universal principle. This is the focus of *Predictions in the Brain*. From the predictions required when a rat navigates a maze to food caching in scrub jays, from predictions essential in decision making to social interactions, from predictions in the retina to the prefrontal cortex, and from predictions in early development to foresight in non-humans. The perspectives represented in this collection span a spectrum from the cellular underpinnings to the computational principles underlying future-related mental processes, and from systems neuroscience to cognition and emotion. In spite of this diversity, they share some core elements. Memory, for instance, is critical in any framework that explains predictions. In asking what is next, our brains have to refer to memory and experience on the way to simulating our mental future. But as much as this collection offers answers to important questions, it raises and emphasizes outstanding ones: How are experiences coded optimally to afford using them for predictions? How do we construct a new simulation from separate memories? How specific in detail are future-oriented thoughts, and when do they rely on imagery, concepts, or language? Therefore, in addition to presenting the state of the art of research and ideas about predictions as a universal principle in mind and brain, it is hoped that this collection will stimulate important new research into the foundations of our mental lives.
