Virus Ecology and Disturbances: Impact of Environmental Disruption on the Viruses of Microorganisms Stephen Tobias Abedon, Heather K Allen, 2015-03-26

Viruses infect numerous microorganisms including predominantly Bacteria bacteriophages or phages but also Archaea Protists and Fungi They are the most abundant and ubiquitous biological entities on Earth and are important drivers of ecosystem functioning Little is known however about the vast majority of these viruses of microorganisms or VoMs Modern techniques such as metagenomics have enabled the discovery and description of more presumptive VoMs than ever before but also have exposed gaps in our understanding of VoM ecology Exploring the ecology of these viruses which is how they interact with host organisms the abiotic environment larger organisms and even other viruses across a variety of environments and conditions is the next frontier Integration of a growing molecular understanding of VoMs with ecological studies will expand our knowledge of ecosystem dynamics Ecology can be studied at multiple levels including individual organisms populations communities whole ecosystems and the entire biosphere Ecology additionally can consider normal equilibrium conditions or instead perturbations Perturbations are of particular interest because measuring the effect of disturbances on VoM associated communities provides important windows into how VoMs contribute to ecosystem dynamics These disturbances in turn can be studied through in vitro in vivo and in situ experimentation measuring responses by VoM associated communities to changes in nutrient availability stress physical disruption seasonality etc and could apply to studies at all ecological levels These are considered here across diverse systems and environments Science John Michels (Journalist), 2011

Integrating Biological Control into Conservation Practice Roy van Driesche, Daniel Simberloff, Bernd Blossey, Charlotte Causton, Mark Hoddle, Christian O. Marks, Kevin M. Heinz, David L. Wagner, Keith D. Warner, 2016-08-01

Invasive species have a critical and growing effect upon natural areas They can modify degrade or destroy wildland ecosystem structure and function and reduce native biodiversity Landscape level solutions are needed to address these problems Conservation biologists seek to limit such damage and restore ecosystems using a variety of approaches One such approach is biological control the deliberate importation and establishment of specialized natural enemies which can address invasive species problems and which should be considered as a possible component of restoration Biological control can be an effective tool against many invasive insects and plants but it has rarely been successfully employed against other groups Safety is of paramount concern and requires that the natural enemies used be specialized and that targeted pests be drivers of ecological degradation While modern approaches allow species to be selected with a high level of security some risks do remain However as in all species introductions these should be viewed in the context of the risk of failing to reduce the impact of the invasive species This unique book identifies the balance among these factors to show how biological control can be integrated into ecosystem restoration as practiced by conservation biologists Jointly

developed by conservation biologists and biological control scientists it contains chapters on matching tools to management goals tools in action measuring and evaluating ecological outcomes of biological control introductions managing conflict over biological control and includes case studies as well as an ethical framework for integrating biological control and conservation practice Integrating Biological Control into Conservation Practice is suitable for graduate courses in invasive species management and biological control as well as for research scientists in government and non profit conservation organizations Environmental Risks of Genetically Engineered Fish United States.
