Identification and Control of Sheet and Film Processes Andrew P. Featherstone, Jeremy G. VanAntwerp, Richard D. Braatz, 2012-12-06 Sheet and film processes include coating papermaking metal rolling and polymer film extrusion Products produced by these processes include paper bumper stickers plastic bags windshield safety glass and sheet metal The total capitalization of industries that rely on these processes is well over 500 billion worldwide These processes are notorious for being difficult to control The goal of this book is to present the theoretical background and practical techniques for the identification and control of sheet and film processes It

is explained why many existing industrial control systems perform poorly for sheet and film processes Identification and control algorithms are described and illustrated which provide consistent and reliable product quality These algorithms include an experimental design technique that ensures that informative data are collected during input output experimentation model identification techniques that produce a process model and an estimate of its accuracy and control techniques that take into account actuator constraints as well as robustness to model uncertainties The algorithms covered in this book are truly the state of the art Variations on some of the algorithms have been implemented on industrial sheet and film processes Other algorithms are in various stages of implementation All of the algorithms have been applied to realistic simulation models constructed from industrial plant data many of these studies are included in this book **Computer**

Process Dynamics, Modeling, and Control Babatunde Ayodeji Ogunnaike, Willis Harmon Ray, 1994 This text offers a modern view of process control in the context of today's technology. It provides the standard material in a coherent presentation and uses a notation that is more consistent with the research literature in process control. Topics that are unique include a unified approach to model representations, process model formation and process identification, multivariable control, statistical quality control and model based control. This book is designed to be used as an introductory text for undergraduate courses in process dynamics and control. In addition to chemical engineering courses, the text would also be suitable for such courses taught in mechanical, nuclear, industrial and metallurgical engineering departments. The material is organized so that modern concepts are presented to the student but details of the most advanced material are left to later chapters. The text material has been developed, refined and classroom tested over the last 10-15 years at the University of

Wisconsin and more recently at the University of Delaware As part of the course at Wisconsin a laboratory has been developed to allow the students hands on experience with measurement instruments real time computers and experimental process dynamics and control problems *Chemical Process Control-VI* James Blake Rawlings,Babatunde Ayodeji Ogunnaike,John W. Eaton,2002 CD ROM contains complete contents of this AIChE symposium series volume and an ISO9660 file system with Rock Ridge attributes **Biological Control Systems and Disease Modelling** Babatunde Ogunnaike,David Bogle,Robert Parker,Julio R. Banga,2021-06-04 Nonlinear Dynamics and Control in Process Engineering — Recent Advances G. Continillo,S. Crescitelli,M. Giona,2012-12-06 The book is a collection of peer reviewed articles on dynamics control and simulation of chemical processes It covers a variety of different methods for approaching process dynamics and control including bifurcation analysis computational fluid dynamics neural network applications numerical simulations of partial differential equations process identification and control Lagrangian analysis of mixing The book is intended both for scientists and engineering involved in process analysis and control and for researchers system engineering mathematicians and physicists interested in nonlinear sciences It provides an overview of the typical problems of chemical and process engineering in which dynamical system theory finds a significant and fertile field of applications **Chemical Process Control-VI** American Institute of Chemical Engineers,2002 **Online Optimization of Large Scale Systems** Martin Grötschel,Sven O. Krumke,Joerg Rambau,2013-03-14 In its thousands of years of history mathematics has made an extraordinary career It started from rules for bookkeeping and computation of areas to become the language of science Its potential for decision support was fully recognized in the twentieth century only vitally aided by the evolution of computing and communication technology Mathematical optimization in particular has developed into a powerful machinery to help planners Whether costs are to be reduced profits to be maximized or scarce resources to be used wisely optimization methods are available to guide decision making Optimization is particularly strong if precise models of real phenomena and data of high quality are at hand often yielding reliable automated control and decision procedures But what if the models are soft and not all data are around Can mathematics help as well This book addresses such issues e.g problems of the following type An elevator cannot know all transportation requests in advance In which order should it serve the passengers Wing profiles of aircrafts influence the fuel consumption Is it possible to continuously adapt the shape of a wing during the flight under rapidly changing conditions Robots are designed to accomplish specific tasks as efficiently as possible But what if a robot navigates in an unknown environment Energy demand changes quickly and is not easily predictable over time Some types of power plants can only react slowly
