### **Sedimentary Facies Reconstruction and Kinematic Restoration of Tight Gas Fields**

Anna Alexandra Vackiner, 2013-03-20 The thesis of Anna Alexandra Vackiner focuses on the geometric architecture and tectonic evolution of the Permian series combining seismic interpretation 3D block field studies in an analogue basin Panamint Valley in California as well as 2D restoration of representative cross sections through time in order to illustrate the complex interaction between multiphase extension inversion and salt diapirism It will be of major interest for exploration geologists involved in tectonically complex areas Fran ois Roure August 2012 This thesis improves the understanding and

localization of the Upper Rotliegend II tight gas reservoir rock facies It provides insights into the detailed Upper Rotliegend II palaeo topography and local tectonically induced sediment thickness changes prior to a multi phase tectonic overprinting The research presented in this study further focuses on the tectonically induced synsedimentary facies distribution in transtensional continental settings on the basis of a comparison with a modern field analogue which enables a detailed analysis of the reservoir rock s distribution and its properties The study is rounded off with an analysis of the influence of the multiphase tectonic overprinting on the mature Upper Rotliegend II reservoir rocks

**Tertiary Deep-Marine Reservoirs of the North Sea Region** T. McKie, P.T.S. Rose, A.J. Hartley, D.W. Jones, T.L. Armstrong , 2015-11-02 Discovery of the Arbroath Montrose and Forties fields initiated intensive exploration of the Tertiary deep marine play in the North Sea region Subsequent discoveries demonstrated the success of this play and the geological diversity of the depositional systems The play is now mature and in many areas the remaining exploration potential is likely to be dominated by small subtle traps with a major component of stratigraphic trapping Economically marginal discoveries need an in depth understanding of subsurface uncertainty to

mitigate risk with limited appraisal wells Mature fields require detailed geological understanding in the search for the remaining oil This volume focuses on the regional depositional setting of these deep marine systems providing a stratigraphic and palaeogeographical context for exploration and development case histories that outline the challenges of producing from these reservoirs The fields are arranged around the production life cycle describing the changing needs of geological models as the flow of static and dynamic data refines geological understanding and defines the nature of new opportunities as fields mature

**Paleozoic Stratigraphy and Resources of the Michigan Basin** G. Michael Grammer, William B. Harrison III, David A. Barnes, 2018-04-12 The Michigan Basin is a classic intracratonic basin that has played a significant role in the fundamental understanding of geological processes in such basins and has been an important resource for oil and gas economic minerals groundwater and coal Despite the classic nature of the Michigan Basin there has not been a special volume dedicated to the basin in nearly 25 years Since that time new advancements in the geological sciences particularly the utilization of high resolution sequence stratigraphy and three dimensional geostatistical modeling have led to a new and more comprehensive understanding of the Paleozoic sedimentary packages of the Michigan Basin This volume provides significant new insights of the Michigan Basin to both academic and applied geoscientists it includes papers that discuss various aspects of the sedimentology and stratigraphy of key units within the basin as well as papers that analyze the diverse distribution of natural resources present in this basin

**Monitoring Land Subsidence Using Remote Sensing** Massimo Fabris, Nicola Cenni, Simone Fiaschi, 2021-09-06 In this book are reported nine works related to land subsidence monitoring using remote sensing techniques Land subsidence is a common phenomenon in many regions of the world where it causes degradation of local ecosystems and disruption of economic activities Its effects are more evident in densely populated areas in particular in low lying territories such as river deltas and coastal areas where the combination of land subsidence and sea level rise increases the flooding risk For this reason the monitoring of ground deformations is a crucial step to obtain important information for the development of risk mitigation strategies In the presented papers the characteristics of land subsidence occurring in different study areas are described and recent developments in the used methodologies for the monitoring of the ground displacements are discussed and validated also by means of ground based data Moreover advantages and disadvantages of the adopted techniques are highlighted The outcomes of these research works can provide national and local authorities with useful information for the implementation of integrated monitoring systems in the areas most affected by land subsidence

**Multiscale Modeling of Deep-water Channel Deposits** Lisa Elizabeth Stright, 2011 Sedimentological models capture the processes and subsequent deposits that explain the distribution of facies within a depositional system The first

sedimentological models for deep water depositional systems were portrayed as idealized shelf break to slope submarine basin sediment dispersal systems These models were developed from ancient outcrop exposures Mutti and Lucchi 1972 and from the modern day seafloor Normark 1970 1978 More recent model development has been based largely on observations from modern slope channels including the Amazon Channel Pirmez and Imran 2003 offshore West African Abreu et al 2003 Deptuck et al 2003 and attempts at generalization from multiple studies Mayall et al 2006 as well as ancient outcrop studies e g Brushy Canyon Gardner et al 2003 Concepts from these sedimentological models have been the principle foundation for development of quantitative geostatistical models A geostatistical model adapts the conceptualization of facies distribution from the sedimentological model This information is then coded into a three dimensional gridded computer model directly constrained to available data i e wireline logs core data and seismic attributes Geostatistical models developed for deep water depositional systems have primarily focused on either sinuous channels confined by levees or erosional surfaces e g Larue and Hovadik 2006 Labourdette et al 2007 Pyrcz et al 2008 McHargue et al 2010 Sylvester et al 2010 or basin floor or overbank lobes associated with loss of confinement from sinuous channels Pyrcz et al 2005 Wellner et al 2006 Zhang et al 2009 Although widely used such geostatistical models have limited applicability in fitting all deep water depositional systems and cases exists that require modification of such models or creation of entirely new models In this dissertation I show the importance of synthesizing sedimentological and geostatistical models based on observations from the data The primary objectives of this dissertation are 1 to present methodologies to enable the creation of better sedimentological models from remote sensing data and 2 to present a means to model depositional architectures for a system that cannot currently be captured with standard geostatistical modeling approaches The main contributions are threefold The first contribution presented in Chapter 1 is a methodology designed to extract subseismic lithologic information from inverted pre stack seismic reflectivities Also in Chapter 1 the predictive power of this methodology is demonstrated on a dataset from the subsurface of the Molasse Basin in Upper Austria Beyond this dissertation Bernhardt et al in review adopted the methodology to support the development of a more predictive sedimentological model for the same dataset The second contribution presented in Chapter 2 is a new approach for building predictive quantitative spatial models for a deep water channel belt in which sand deposition is controlled by mass transport deposit topography This methodology leverages sedimentological interpretations derived from subseismic lithologic information as presented in Chapter 1 and the sedimentological work of Bernhardt et al in review The final contribution of this dissertation is presented in two outcrop studies Chapters 3 and 4 utilize extensive data collected from deep water channel outcrops to build digital outcrop models The model from Chapter 3 is used to demonstrate the predictive power of pre stack seismic reflectivity data in interpreting the large scale architecture of a heterolithic deep water channel system exposed in the sea cliffs along Blacks Beach near La Jolla California Finally the outcrop modeling study presented in Chapter 4 presents a methodology to capture structural and stratigraphic uncertainty in

outcrop observations in order to analyze the three dimensional channel morphology of the Cerro Toro deep water channel belt exposed in Sierra del Toro outcrops in the Magallanes Basin of Chile These four chapters are described in more detail below

**Structure and Diagenesis in Upper Carboniferous Tight Gas Reservoirs in NW Germany** Wuestefeld, Patrick,2018-03-02 Upper Carboniferous sandstones are important tight gas reservoirs in Central Europe This field based study conducted in a km scale reservoir outcrop analog Piesberg quarry Lower Saxony Basin NW Germany focused on the diagenetic control on spatial reservoir quality distribution Geothermometers were used to characterize a fault related thermal anomaly A prototype workflow based on terrestrial laser scanning is presented which allowed for the automated detection and analysis of fractures

Natural Methane Emissions in a Changing Arctic - Implications for Climate and Environment Karin Andreassen,Jochen Knies,Susanne Liebner,Andrew Jonathan Hodson ,Carolyn Ruppel,2024-11-06 Natural emissions of methane have received much attention over the last decade due to the documented increase of methane in the atmosphere and high global warming potential relative to CO<sub>2</sub> Over the past few decades the Arctic has been warming approximately four times faster than the rest of the planet driving a pressing need to assess the current and future

vulnerability of various natural methane sources In the Arctic vast amounts of methane is stored in soils and permafrost or is being generated as permafrost thaw continues Additionally there are large stores of methane in Arctic gas hydrates a solid form of concentrated methane and water and in numerous settings including deep water marine areas on continental shelves hosting relict subsea permafrost and gas hydrate in and beneath onshore permafrost and likely beneath the Greenland Ice Sheet Continued climate warming is making methane leakage more likely Even deeper conventional gas reservoirs could leak methane as the overlying permafrost degrades
