Polymeric Materials José Alejandro Heredia-Guerrero, Athanassia Athanassiou, 2016-05-17 Plants are the most important renewable source of feedstock for polymeric materials. They are a resource of monomers and macromolecules after the appropriate chemical treatment. By analogy with the petrochemistry industry, plant macromolecules are depolymerized into simpler units which are generally chemically modified and re-bound to produce new polymers. The properties of these polymers are usually tailored by small chemical changes in their molecular structure or by the polymerization of plant monomers with other molecules. Another interesting strategy for the formation of polymeric materials is the direct use of plant macromolecules in the form of blends, composites, grafted polymers, multilayer systems, etc. The interactions and assemblies of the different components allow the control of the final features of such materials. Traditionally, polysaccharides with cellulose as the main protagonist have been the most used substances. However, as a consequence of a growing demand of functional plastics, other plant macromolecules, habitually considered wastes, have started to become valuable raw materials. Lignin and plant proteins, mainly soy protein, wheat gluten, and zein, are classical examples. Also, suberin has been highlighted in this field. Other plant polymers, such as the cutin and the sporopollenin, are promising alternatives. Furthermore, other minority plant polymers, e.g., cutan or algaenan, could be potential sources of materials. The different chemistry, structure, intrinsic properties, and functions of these macromolecules in the plants are a strong inspiration for the development of novel and interesting polymeric materials. Here, in this Research Topic, we welcome the submission of manuscripts related to the production, extraction, processability, synthesis, characterization, and applications of non-polysaccharide plant materials.

Commerce Today, 1974-10 [The Medical Journal of Australia](#), 1963 **Mycoplasma pneumoniae Clinical Manifestations, Microbiology, and Immunology** Ran Nir-Paz, Takeshi Saraya, Takashi Shimizu, Annemarie Van Rossum, Cécile Bébéar, 2017-12-12 Mycoplasma pneumoniae (Mp) is a major human pathogen that causes both upper and lower respiratory infections and is one of the leading causes of community-acquired pneumonia (CAP), accounting for 11-15% of CAP throughout the world. Additionally, it is known to induce an inflammatory process which depends on several mechanisms, such as virulence of Mp lipoproteins, community-acquired respiratory distress syndrome (ARDS), toxin, oxidative products, and host defenses, cellular immunity, and humoral immunity. Although it is a common pathogen, the pathogenesis for Mp infections is not yet fully understood. From the clinical point of view, since the pioneer studies in the 1960s and 1970s on the clinical presentation of Mp-associated disease, the diagnostics approaches have changed dramatically, leading to a better understanding of the clinical presentation, and new issues have emerged, such as antibiotic resistance. The purpose of this Frontiers eBook is to thoroughly review and discuss the clinical presentation in view of the improved diagnostics, microbiological and immunological analysis of Mp infections, with focus on the history of Mp clinical features, of disease, bacterial structure of Mp, and mechanism of gliding, clinical and laboratory diagnostics, the role of lipoproteins and Toll-like receptor (TLR), ARDS toxin, subtyping of Mp isolates, and genome analysis, macrolide resistance, and treatment. *Discovery*, 1955
