Theocaris, E.E. Gdoutos, 2013-06-29 Photoelasticity as an experimental method for analyzing stress fields in mechanics was developed in the early thirties by the pioneering works of Mesnager in France and Coker and Filon in England Almost concurrently F ppl Mesmer and Oppel in Germany contributed

significantly to what turned out to be an amazing development. Indeed in the fifties and sixties a tremendous number of scientific papers and monographs appeared all over the world dealing with various aspects of the method and its applications in experimental stress analysis. All of these contributions were based on the so called Neumann Maxwell stress optical law they were developed by means of the classical methods of vector analysis and analytic geometry using the conventional light vector concept. This way of treating problems of mechanics by photoelasticity indicated many shortcomings and drawbacks of this classical method especially when three dimensional problems of elasticity had to be treated and when complicated load and geometry situations existed. Meanwhile the idea of using the Poincare sphere for representing any polarization profile in photoelastic applications was introduced by Robert in France and Aben in the USSR in order to deal with problems of polarization of light passing through a series of optical elements retarders and/or rotators. Although the Poincare sphere presentation of any polarization profile constitutes a powerful and elegant method it exhibits the difficulty of requiring manipulations in three dimensional space on the surface of the unit sphere. However other graphical methods have been developed to bypass this difficulty.
