

Question 1:

Consider a block of mass m attached to a spring with force constant k , as shown in the figure. The spring can be either stretched or compressed. The block slides on a frictionless horizontal surface, as shown. When the spring is relaxed, the block is located at $x = 0$. If the block is pulled to the right a distance A and then released, A will be the amplitude of the resulting oscillations. Assume that the mechanical energy of the block-spring system remains unchanged in the subsequent motion of the block.

- a) After the block is released from $x = A$, it will:
- remain at rest.
 - move to the left until it reaches equilibrium and stop there.
 - move to the left until it reaches $x = -A$ and stop there.
 - move to the left until it reaches $x = -A$ and then begin to move to the right.

The time it takes the block to complete one cycle is called the period. Usually, the period is denoted T and is measured in seconds.

The frequency, denoted f , is the number of cycles that are completed per unit of time: $f = 1/T$. In SI units, f is measured in inverse seconds, or hertz (Hz).

- b) If the period is doubled, the frequency is:

- unchanged.
- doubled.
- halved.

- c) An oscillating object takes 0.10 s to complete one cycle; that is, its period is 0.10 s. What is its frequency f ?

- d) If the frequency is 40 Hz, what is the period T ?

The following questions refer to the second figure below that graphically depicts the oscillations of the block on the spring. Note that the vertical axis represents the x coordinate of the oscillating object, and the horizontal axis represents time.

- e) Which points on the x axis are located a distance A from the equilibrium position?
- R only.
 - Q only.
 - both R and Q.
- f) Suppose that the period is T . Which of the following points on the t axis are separated by the time interval T ?
- K and L.
 - K and M.
 - K and P.
 - L and N.
 - M and P.

Now assume for the remaining Parts g) – j), that the x coordinate of point R is 0.12 m and the t coordinate of point K is 0.0050 s.

- g) What is the period T ?

Hint: In moving from the point $t = 0$ to the point K, what fraction of a full wavelength is covered? Call that fraction a . Then you can set $aT = 0.0050$ s. Dividing by the fraction a will give the period T .

- h) How much time t does the block take to travel from the point of maximum displacement to the opposite point of maximum displacement?
- i) What distance d does the object cover during one period of oscillation?
- j) What distance d does the object cover between the moments labeled K and N on the graph?

Question 2:

Consider a harmonic oscillator at four different moments, labeled A, B, C, and D, as shown in the figure below. Assume that the force constant k , the mass of the block, m , and the amplitude of vibrations, A , are given. Answer the following questions.

- a) Which moment corresponds to the maximum potential energy of the system?
- b) Which moment corresponds to the minimum kinetic energy of the system?

Oscillation Problems Target Publications:

Electromagnetic Scattering by a Linearly Oscillating Target Ralph E. Kleinman, 1975 A theoretical analysis is presented in this report which shows that when a plane electromagnetic wave is incident upon a perfectly conducting linearly oscillating arbitrarily shaped target the scattered far field differs only in phase from the field scattered when the target is motionless. The explicit form of the phase modulation factor is derived to an accuracy of the order of v/c where v and c are the velocities of target motion and electromagnetic waves respectively. Spectral analysis of the modulation shows that the power distribution varies with the shape of the motion wavelength of the incident field and magnitude of the projections of the oscillation in the incident and receiver directions. Power spectra are calculated for square, triangular and sinusoidal periodic target motion as well as a superposition of two sinusoids of different frequency and amplitude. The results indicate that even small amplitude oscillations produce measurable modulations of the scatter field. Author **NIST Special Publication**

Systems for the Generation of Complex Behavior: From Biology to Technology Poramate Manoonpong, Christian Tetzlaff, 2018-10-11 How can neural and morphological computations be effectively combined and realized in embodied closed loop systems e.g. robots such that they can become more like living creatures in their level of performance. Understanding this will lead to new technologies and a variety of applications. To tackle this research question here we bring together experts from different fields including Biology, Computational Neuroscience, Robotics and Artificial Intelligence to share their recent findings and ideas and to update our research community. This eBook collects 17 cutting edge research articles covering neural and morphological computations as well as the transfer of results to real world applications like prosthesis and orthosis control and neuromorphic hardware implementation **Index to IEEE Publications** Institute of Electrical and Electronics Engineers, 1995 Issues for 1973 cover the entire IEEE technical literature **Lagrangian and Hamiltonian Methods for Nonlinear Control 2003** A Astolfi, Francisco Gordillo, A J Van Der Schaft, 2003-10-07 This is the second of a series of IFAC Workshops initiated in 2000. The first one chaired and organized by Profs N. Leonard and R. Ortega was held in Princeton in March 2000. This proceedings volume looks at the role played by Lagrangian and Hamiltonian methods in disciplines such as classical mechanics, quantum mechanics, fluid dynamics, electrodynamics, celestial mechanics and how such methods can be practically applied in the control community. Presents and illustrates new approaches to nonlinear control that exploit the Lagrangian and Hamiltonian structure of the system to be controlled. Highlights the important role of Lagrangian and Hamiltonian Structures as design methods **Conference Publication**, 1976
