

# Cellular Respiration—An Overview

What are the phases of cellular respiration?

## Why?

All cells need energy all the time, and their primary source of energy is ATP. The methods cells use to make ATP vary depending on the availability of oxygen and their biological make-up. In many cases the cells are in an oxygen-rich environment. For example, as you sit and read this sentence, you are breathing in oxygen, which is then carried throughout your body by red blood cells. But, some cells grow in environments without oxygen (yeast in wine-making or the bacteria that cause botulism in canned food), and occasionally animal cells must function without sufficient oxygen (as in running sprints). In this activity you will begin to look at the aerobic and anaerobic processes that are used by all organisms to produce ATP.

## Model 1 – Cellular Respiration

1. According to Model 1, what are the reactants of cellular respiration?

Glucose and Oxygen

2. According to Model 1, what are the products of cellular respiration?

Carbon dioxide, water, and energy(ATP)
