**Regulation of Gene Expression in Plants** Carole L. Bassett, 2007-02-15 Except for one area of gene expression control plant research has significantly fallen behind studies in insects and vertebrates The advances made in animal gene expression control have benefited plant research as we continue to find that much of the machinery and mechanisms controlling gene expression have been preserved in all eukaryotes Through comparison we have learned that certain aspects of gene regulation are shared by plants and animals i e both contain introns separating the coding regions of most genes and both utilize similar machinery to process the introns to form mature mRNAs Yet there are some interesting differences in gene structure and regulation between plants and animals For example unlike animal genes plant genes are generally much smaller with fewer and smaller introns Regulation of Gene Expression in Plants presents some of the most recent novel and fascinating examples of transcriptional and posttranscriptional control of gene expression in plants and where appropriate provides comparison to notable examples of animal gene regulation *Eukaryotic Gene Regulation*, 1980

*Control of Gene Expression*, 1974 **Control of Plant Gene Expression** Desh Pal S. Verma, 1993 Control of Plant Gene Expression is a comprehensive volume describing the regulation and control of specific plant genes expressed in different tissues during plant development It addresses several fundamental aspects of plant gene regulation including signal transduction mechanisms and the role of plant hormones It also discusses the structure and regulation of important metabolic genes such as those involved in nitrogen and carbon assimilation lipid biosynthesis and secondary metabolism The book provides excellent examples of genetic engineering applications to alter agronomically important traits making it an essential reference volume for plant molecular biologists and plant biotechnologists It also contains a wealth of information that will be valuable to students specializing in plant molecular biology plant development gene regulation in plants molecular plant physiology or plant biotechnology **Long-range Control of Gene Expression** Aghajan, Cavallaro, 2008

Not Available **Translational Regulation of Gene Expression 2** J. Ilan, 2012-10-24 This book which results from the dramatic increase in interest in the control mechanism employed in gene expression and the importance of the regulated proteins presents new information not covered in Translational Regulation of Gene Expression which was published in 1987 It is not a revision of the earlier book but rather an extension of that volume with special emphasis on mechanism As the reader will discover there is enormous diversity in the systems employing genes for translational regulation in order to regulate the appearance of the final product the protein Thus we find that important proteins such as protooncogenes growth factors stress proteins cytokines lymphokines iron storage and iron uptake proteins and a panorama of prokaryotic proteins

as well as eukaryotic viral proteins are translationally regulated. Since for some gene products the degree of control is greater by a few orders of magnitude than their transcription, we can state that for these genes at least the expression is translationally controlled. Translational regulation of gene expression in eukaryotes has emerged in the last few years as a major research field. The present book describes mechanisms of translational regulation in bacteria, yeast, and eukaryotic viruses as well as in eukaryotic genes. In this book we try to provide in-depth coverage by including important examples from each group rather than systematically including all additional systems not described in the previous volume.

*Plastid Proteostasis: Relevance of Transcription, Translation and Post-Translational Modifications* Fiammetta Alagna, Michele Bellucci, Dario Leister, Andrea Pompa, 2017-12-28. Due to their bacterial endosymbiotic origin, plastids are organelles with both nuclear encoded and plastid encoded proteins. Therefore, a highly integrated modulation of gene expression between the nucleus and the plastome is needed in plant cell development. Plastids have retained for the most part a prokaryotic gene expression machinery but differently from prokaryotes and eukaryotes they have largely abandoned transcriptional control and switched to predominantly translational control of their gene expression. Some transcriptional regulation is known to occur but the coordinate expression between the nucleus and the plastome takes place mainly through translational regulation. However, the regulatory mechanisms of plastid gene expression (PGE) are mediated by intricate plastid-nuclear interactions and are still far from being fully understood. Although, for example, translational autoregulation mechanisms in algae have been described for subunits of heteromeric protein complexes and termed control by epistasy of synthesis (CES), only a few autoregulatory proteins have been identified in plant plastids. It should be noted of course that PGE in *C. reinhardtii* is different from that in plants in many aspects. Another example of investigation in this research area is to understand the interactions that occur during RNA binding between nucleus encoded RNA binding proteins and the respective RNA sequences and how this influences the translation initiation process. In addition to this, the plastid retains a whole series of mechanisms for the preservation of its protein balance (proteostasis) including specific proteases as well as molecular chaperones and enzymes useful in protein folding. After synthesis, plastid proteins must rapidly fold into stable three-dimensional structures and often undergo co- and posttranslational modifications to perform their biological mission, avoiding aberrant folding, aggregation, and targeting with the help of molecular chaperones and proteases. We believe that this topic is highly interesting for many research areas because the regulation of PGE is not only of wide interest for plant biologists but has also biotechnological implications. Indeed, plastid transformation turns out to be a very promising tool for the production of recombinant proteins in plants, yet some limitations must still be overcome and we believe that this is mainly due to our limited knowledge of the mechanisms in plastids influencing the maintenance of proteostasis.

Perdew,Jack P. Vanden Heuvel,Jeffrey M. Peters,2008-08-17 The use of molecular biology and biochemistry to study the regulation of gene expression has become a major feature of research in the biological sciences Many excellent books and reviews exist that examine the experimental methodology employed in specific areas of molecular biology and regulation of gene expression However we have noticed a lack of books especially textbooks that provide an overview of the rationale and general experimental approaches used to examine chemically or disease mediated alterations in gene expression in mammalian systems For example it has been difficult to find appropriate texts that examine specific experimental goals such as proving that an increased level of mRNA for a given gene is attributable to an increase in transcription rates Regulation of Gene Expression Molecular Mechanisms is intended to serve as either a textbook for graduate students or as a basic reference for laboratory personnel Indeed we are using this book to teach a graduate level class at The Pennsylvania State University For more details about this class please visit <http://moltox.cas.psu.edu> and select Courses The goal for our work is to provide an overview of the various methods and approaches to characterize possible mechanisms of gene regulation Further we have attempted to provide a framework for students to develop an understanding of how to determine the various mechanisms

that lead to altered activity of a specific protein within a cell

**Volume 39, Regulation Gene Expression** I. R. Booth, 1986-04-17 This volume describes the regulatory mechanisms which operate at the level of gene expression The authors primarily discuss bacterial systems but some consideration is also given to lower eukaryotes The early chapters of the book deal with regulation of gene expression in the context of cellular physiology Subsequent chapters deal with the major new developments in our understanding of the molecular basis of the control of gene expression namely promoter operator structure DNA protein interaction control of mRNA turnover positive regulation of gene expression antisense RNA DNA supercoiling and transcription termination The final two chapters consider specific problems in gene expression in Streptomyces and in Dictyostelium Translational Regulation of Gene Expression

J. Ilan, 2012-03-18 Given the accelerated growth of knowledge in the field of gene expression it seemed timely to discuss current developments in the area of translational regulation of gene expression as well as to evaluate emerging technology Translational regulation occurs with prokaryotic as well as with eukaryotic messenger RNA mRNA in vivo and in vitro In prokaryotes through genetic manipulations and mutagenesis the mechanisms are much better understood as for example the mechanism of attenuation In bacteria different translational efficiencies for the same mRNA may vary by 1000 fold Translational regulation was first observed in 1966 with RNA phages of Escherichia coli by Lodish and Zinder However translational regulation of proteins from DNA genomes is also well described for bacteria as for example gene 32 protein of bacteriophage T4 and E coli ribosomal proteins In eukaryotes the utilization of an individual mRNA species with different efficiencies is poorly understood For example mRNA for ribosomal proteins is translationally regulated during Drosophila oogenesis without any clue to the mechanism involved It was observed that ribosomal protein mRNA during Drosophila oogenesis and embryogenesis is selectively on or off the polysomes during different developmental stages In contrast bacterial ribosomal protein is also translationally regulated by autogenous regulation The mechanism is well understood and involves binding of the gene product to its transcript in competition with rRNA **Biophysical Approaches to**
