Transport in Cells

How do water molecules move in and out of cells?

Why?

Water accounts for over 70% of the human body. If water levels are not regulated and maintained in an organism the consequences can be disastrous. ~~Cells and tissues may swell~~, ~~blood cells burst~~, or the ~~brain may expand~~ so much it ~~pushes on the skull~~, leading to ~~brain damage and death~~. So what exactly is the process that allows organisms to regulate and maintain their water content?

Model 1 – Movement of Water In and Out of Cells

-  Sugar molecules (solute)
-  Water molecules (solvent)
-  Selectively permeable membrane

Pogil Transport In Cells Key:

Intracellular Transport Katherine Brehme Warren, 2014-05-12 Intracellular Transport is a collection of papers that examines the processes of and the mechanisms underlying intracellular transport. One paper describes that all active transport processes in the amoeba are intracellular and depend on dynamic transformations of membrane into cytoplasm and of cytoplasm into membrane. Another paper discusses the kinetics of membrane transport of which the phenomena of counterflow can become a mobile carrier system. The paper notes that the specific transport properties of membranes are conferred by the proteins of the surfaces that are grouped as macromolecular complexes probably similar to those of enzymes. One paper describes the concept of parametric pumping an oscillation driven separation process as a possible model for active transport in biological cells. Another paper compares the fine scale diffusion effects that happen in a mixture without large scale concentration gradients and where the effect are on a large scale. The homogenous kinetic law can be used in the large scale situation the law already can account for any of the fine scale diffusion effects. The paper notes that without large scale concentration gradients the transport event is from a local region to a nearby reaction site only. Where the effects are on a large scale the diffusion results in a gross transport of over distances larger than molecular dimensions. This collection can prove useful for mathematicians cellular biologists physical chemists physiologists electron microscopists geneticists and engineers.

Intracellular junctions provide routes for direct cell to cell signalling in both plants and animals. The present volume treats the parallels and differences between such junctions in animals and plants and discusses the most recent methods of examining the physiological functions and regulation of intracellular communication. Strong evidence of both molecular as well as functional similarities between plasmodesmata and gap junctions is increasing. Even more interesting is the discovery that animal gap junction proteins cross react immunologically with some proteins in plant cells. Thus the molecular construction and function of these crucially important ultrastructural cell components is now open to a concerted research effort to understand how cells both plant and animal facilitate and regulate intercellular transport.
