Introduction: During the process of photosynthesis, oxygen is released. The release of oxygen can be visibly observed in aquatic plants as bubbles. Counting the number of bubbles released over a period of time can serve as a measurement of the rate of photosynthesis.

There are factors that can increase the rate of photosynthesis in plants. This simulation will explore those factors.

Procedure: You will change the variables and record the number of bubbles released in a minute. Use the clock and the start / stop buttons.

Experiment 1: How Does Changing the Light Intensity and Distance Affect Photosynthesis?

1. Make a prediction about what you think will happen: As you increase the light intensity, the number of bubbles will
2. Start with the 40W power source and observe one minute. Leave the distance at 50 cm for each trial in this section. Reset and switch to 100W. Record data in the Data table.
3. Reset the simulation and test how changing the distance from the light will affect the rate of photosynthesis.
4. Prediction: As you increase the distance of the light, the number of bubbles will

	Light Intensity (at 50 cm)		Light Distance (100 W bulbs)	
	40 W (50cm)	100 W (50cm)	50 cm	100 cm
Number of Bubbles (1 Min)				

5. Summarize the results and provide an explanation or reasoning for what was observed. How does light intensity and distance affect the rate of photosynthesis? How do you know?

6. In this experiment, the independent (manipulated) variable is the _____ a) light b) number of bubbles
the dependent (responding) variable the _____ a) light b) number of bubbles
