Linear Measure

Measure Line Segments A part of a line between two endpoints is called a **line segment**. The lengths of \overline{MN} and \overline{RS} are written as MN and RS . All measurements are approximations dependent upon the smallest unit of measure available on the measuring instrument.

Example 1: Find the length of \overline{MN} .

The long marks are centimeters, and the shorter marks are millimeters. There are 10 millimeters for each centimeter. The length of \overline{MN} is about 3.4 millimeters.

Example 2: Find the length of \overline{RS} .

The long marks are inches and the short marks are quarter inches. Point S is closer to the $1\frac{3}{4}$ inch mark.

The length of \overline{RS} is about $1\frac{3}{4}$ inches.

between HRV and Heart Rate Karin Trimmel, Jerzy Sacha, Heikki Veli Huikuri, 2015-10-07 Over the last decades assessment of heart rate variability HRV has increased in various fields of research HRV describes changes in heartbeat intervals which are caused by autonomic neural regulation i e by the interplay of the sympathetic and the parasympathetic nervous systems The most frequent application of HRV is connected to cardiological issues most importantly to the monitoring of post myocardial infarction patients and the prediction of sudden cardiac death Analysis of HRV is also frequently applied in relation to diabetes renal failure neurological and psychiatric conditions sleep disorders psychological phenomena such as stress as well as drug and addiction research including alcohol and smoking The widespread application of HRV measurements is based on the fact that they are noninvasive easy to perform and in general reproducible if carried out under standardized conditions However the amount of parameters to be analysed is still rising Well established time domain and frequency domain parameters are discussed controversially when it comes to their physiological interpretation and their psychometric properties like reliability and validity and the sensitivity to cardiovascular properties of the variety of parameters seems to be a topic for further research Recently introduced parameters like pNNxx and new dynamic methods such as approximate entropy and detrended fluctuation analysis offer new potentials and warrant standardization However HRV is significantly associated with average heart rate HR and one can conclude that HRV actually provides information on two quantities i e on HR and its variability It is hard to determine which of these two plays a principal role in the clinical value of HRV The association between HRV and HR is not only a physiological phenomenon but also a mathematical one which is due to non linear mathematical relationship between RR interval and HR If one normalizes HRV to its average RR interval one may get pure variability free from the mathematical bias Recently a new modification method of the association between HRV and HR has been developed which enables us to completely remove the HRV dependence on HR even the physiological one or conversely enhance this dependence Such an approach allows us to explore the HR contribution to the

clinical significance of HRV i.e whether HR or its variability plays a main role in the HRV clinical value This Research Topic covers recent advances in the application of HRV methodological issues basic underlying mechanisms as well as all aspects of the interaction between HRV and HR

Social Support Measurement and Intervention Sheldon Cohen, Lynn G. Underwood, Benjamin H. Gottlieb, 2000-10-19 Surgery and pharmaceuticals are not the only effective procedures we have to improve our health The natural human tendency to care for fellow humans to support them with social networks has proven to be a powerful treatment as well As a result the areas of application for social support intervention have expanded dramatically during the past 20 years As these areas have expanded so too has the literature on the theory and measurement of social support Yet the literature has focussed on very particular areas Investigators in the social sciences have mainly focused on the protection that social support confers in the context of stressful life events and transitions whereas studies in the health sciences have concentrated on the effects of social networks and supports on population mortality and morbidity Although no single theoretical framework has been widely accepted there is consensus that both the psychological sense of support and actual expressions of support play critical roles in maintaining health and well being This book is a state of the art resource for the selection and development of strategies for social support assessment and intervention Designed for use by behavioral and medical scientists conducting studies of physical illness psychological adjustment and psychiatric illness in human populations this volume presents a broad conceptual framework addressing the role of social support in mental and physical health The book is divided into four sections The first provides some historical context as well as a conceptual overview of how social support might influence mental and physical health The second discusses techniques for measuring social networks and support and the third addresses the design of different types of support interventions The final section presents some general comments on the volume and its implications for social support research and intervention This resource is meant to aid researchers in understanding the conceptual criteria on which measurement and intervention decisions should be made when studying the relations between social support and health Furthermore the information provided on both measurement and intervention will be valuable to practitioners interested in designing and evaluating prevention and treatment initiatives Sponsored by the Fetzer Institute as a follow up to their successful 1995 publication *Measuring Stress* this book will provide the most up to date research on the effects of social support interventions on physical and mental health
