Teaching to Learn Kenneth George Tobin, 2006 A recurrent trope in education is the gap that exists between theory taught at the university and praxis what teachers do in classrooms How might one bridge this inevitable gap if new teachers are asked to learn to talk about teaching rather than to teach In response to this challenging question the two authors of this book have developed coteaching and cogenerative dialoguing two forms of praxis that allow very different stakeholders to teach and subsequently to reflect together about their teaching The authors have developed these forms of praxis not by theorizing and then implementing them but by working at the elbow of new and experienced teachers students supervisors and department heads Coteaching which occurs when two or more teachers teach together supports learning to teach while improving student achievement Cogenerative dialogues are conversations among all those who have been present in a lesson they ensure that what was learned while coteaching is beneficial for all coteachers and learners Tobin and Roth describe the many ways coteaching and cogenerative dialogues are used to improve learning environments dramatically improving teaching and learning across cultural borders defined by race ethnicity gender and language Teaching to Learn is written for science educators and teacher educators along the professional continuum new and practicing teachers graduate students professors researchers curriculum developers evaluation consultants science supervisors school administrators and policy makers Thick ethnographic descriptions and specific suggestions provide readers access to resources to get started and continue their journeys along a variety of professional trajectories

Dynamics of Protein Synthesis Initiation Rebecca Jasmina Rousseau,2019 In this thesis I investigate the underlying physical mechanisms by which cells optimize their rates of protein synthesis and thus their growth and function targeting specifically the role of relative tRNA availabilities in limiting the rate of amino acid incorporation during translation Although extensive literature focuses on maximizing the amino acid incorporation rate the physical importance of additionally maximizing the entropy of a system remains unexplored To shed light on this I develop a maximum entropy model that predicts the distribution of likely sets of tRNA abundances required to produce the essential proteins of a given cell type for an initial set of codon frequencies Further analytical work reveals among other critical implications the necessity of a tradeoff between entropy and maximization of the protein synthesis rate and defines the minimum information required to achieve a given mean synthesis rate With the theoretical framework established I then utilize numerical methods and Monte Carlo simulations to characterize and manipulate the selectivity of the solution space for tRNA abundance sets of the model system E coli under different experimental settings thereby demonstrating the feasibility of achieving the predicted minimum incorporation time At the localization limit I also show that optimal tRNA abundance solutions involve largely mid range concentration levels but are distinctly nonuniform with individual tRNAs varying by the importance of the corresponding cognate codon in the production of essential proteins The model accurately predicts and fine tunes a quantitative description of tRNA abundance optimization and also provides from

appropriate experimental data a direct diagnostic on the priorities of natural cell states when optimizing along the spectrum of the entropy synthesis rate tradeoff *Protein Synthesis* Edwin H. McConkey, 1971 Translation and Protein Synthesis, 1999
