Developing threats Great Britain: Parliament: House of Commons: Defence Committee, 2012-02-22 Technologies such as GPS vital to the financial markets as well as the military are known to be vulnerable to the effects of space weather or the EMP resultant from a nuclear weapon exploded at altitude It is also possible to build non nuclear devices which can disrupt electronic systems though so far only over a limited area A severe space weather event is not necessarily seen as a military problem in the first instance but it would be likely to meet the definition of an emergency under the Civil Contingencies Act 2004 and call for the help of the Armed Forces The reactive posture described by the Government appears somewhat complacent The Committee is very concerned that there appears to be no one Government Department identified to take immediate lead responsibility should there be a severe space weather event The Government must make clear exactly where lead responsibility in relation to EMP disturbances lies both nationally and within the MoD Defence alone cannot protect against the threat of EMP It must be a concern of the National Security Council and civil contingency planners with proper standards of protection developed with the vital service industries most at risk The effects of a High Altitude Electro Magnetic Pulse Event as a result of a nuclear weapon exploded at high altitude would be so serious that only government action could be expected to mitigate it Security of satellites is a matter of growing concern as our reliance upon such systems and the sheer number of satellites in orbit increase **Enhancing the Resilience of the Nation's Electricity System**

National Academies of Sciences, Engineering, and Medicine, Division on Engineering and Physical Sciences, Board on Energy

and Environmental Systems, Committee on Enhancing the Resilience of the Nation's Electric Power Transmission and Distribution System, 2017-10-25 Americans safety productivity comfort and convenience depend on the reliable supply of electric power The electric power system is a complex cyber physical system composed of a network of millions of components spread out across the continent These components are owned operated and regulated by thousands of different entities Power system operators work hard to assure safe and reliable service but large outages occasionally happen Given the nature of the system there is simply no way that outages can be completely avoided no matter how much time and money is devoted to such an effort The system's reliability and resilience can be improved but never made perfect Thus system owners operators and regulators must prioritize their investments based on potential benefits Enhancing the Resilience of the Nation's Electricity System focuses on identifying developing and implementing strategies to increase the power system's resilience in the face of events that can cause large area long duration outages blackouts that extend over multiple service areas and last several days or longer Resilience is not just about lessening the likelihood that these outages will occur It is also about limiting the scope and impact of outages when they do occur restoring power rapidly afterwards and learning from these experiences to better deal with events in the future
