Animal Models in Eye Research

,2011-04-28 The eye is a complex sensory organ which enables visual perception of the world Thus the eye has several tissues that do different tasks One of the most basic aspects of eye function is the sensitivity of cells to light and its transduction though the optic nerve to the brain Different organisms use different ways to achieve these tasks In this sense eye function becomes a very important evolutionary aspect as well This book presents the different animal models that are commonly used for eye research and

their uniqueness in evaluating different aspects of eye development evolution physiology and disease Presents information on the major animal models used in eye research including invertebrates and vertebrates Provides researchers with information needed to choose between model organisms Includes an introductory chapter on the different types of eyes stressing possible common molecular machinery *Catalog of Copyright Entries. be produced by phospholipases D but also by diacylglycerol kinases coupled to phospholipases C. Proteins that bind phosphatidic acid and for which the activity is altered upon binding have been identified. Furthermore, other lipids are also important in signalling processes. PA can be phosphorylated into diacylglycerol pyrophosphate and plants are one of the first biological models where the production of this lipid has been reported and its implication in signal transduction has been demonstrated. PA can also be deacylated into lyso phosphatidic acid. The phosphorylated phosphatidylinositols, i.e. the phosphoinositides, can act as substrate of phospholipases C but are also mediating lipids per se since proteins that bind them have been identified. Other important lipid mediators belong to the sphingolipid family such as the phosphorylated phytosphingosine or long chain bases. Many questions remain unanswered concerning lipid signalling in plants. Understanding and discussing current knowledge on these mechanisms will provide insights into plant mechanisms in response to constraints, either developmental or environmental.
