

The Learning Curve

The correlation between a learner's performance on a task and the number of attempts or time required to complete the task.

Learning curve formula

$$Y = aX^b$$

- Y = average time over the measured duration
- a = time spent to complete the task the first time
- X = total amount of attempts completed
- b = slope of the function

The Learning Curve:

How to Use the Learning Curve Raymond Jordan, 1972 **The Learning Curve** Alan Fletcher, 1996 **The Learning Curve Deskbook** Charles J. Teplitz, 1991-05-23 Learning curves are now recognized throughout the business community as valuable aids to improving productivity in the workplace This volume is a clear and concise handbook intended to provide both the technical and the non technical reader with a basic understanding of the underlying theory of learning curves as well as ready access to commonly used learning curve models formulas and tables Since the book itself is meant to be a handy reference guide it is organized to make needed information easily available After a review of basic learning curve theory and a comparison of the most frequently used models an extensive list of equations is accompanied by everyday examples that illustrate the correct application of learning curve theory as well as solutions to problems that may arise Tables graphs and charts easily located in the appendixes can facilitate computations and a bibliography lists articles pamphlets and books that describe learning curve theory and its various uses over the past fifty years Learning curve analysis simplified and presented here in a convenient manual will enable accounting financial and purchasing specialists to improve not only employee proficiency forecasting but also the efficiency of their own productivity **The Learning Curve** Bernadette Koroscil, 2006 **Learning Curves** Mohamad Y. Jaber, 2016-04-19 Written by international contributors Learning Curves Theory Models and Applications first draws a learning map that shows where learning is involved within organizations then examines how it can be sustained perfected and accelerated The book reviews empirical findings in the literature in terms of different sources for learning and partia **Improving the Application of the "Learning Curve"** Roland Nathan Kalonji, 2018-02-01 Project Report from the year 2017 in the subject Engineering General language English abstract There exist some fields in which the learning curves can be applied they have a much wider applications including manufacturing and marketing strategy However they underlay the concept of continuous improvement pricing decisions work scheduling standard setting direct labour budget etc Learning curve states that decreasing man hours are required to accomplish any repetitive task as the operation is continued then knowledge of learning curve can be useful both in planning and control Estimates of learning curves are used in many applications in organizations and they can be effective with the job which is repetitive in nature particulars with same machinery and tools thus this study aims at improving the application of the learning curve which describes how knowledge is acquired and retained when people repeat a process The overall purpose of this report is to determine whether or not the learning curve theory can be replicated Data will be gathered based on the England flyer folding instructions thereafter we will be plotting the learning curve by calculating the cumulative average estimating the table of unit improvement curves and determining the learning rate When a new product or process is started performance of worker is not at its best and learning phenomenon takes place As the experience is gained the performance of worker improves time taken per unit reduces and then his productivity goes up Thus people who learn always

increase their experience they gain skill and ability from their own experience and the results throughout processes are improved The usual use of learning curves is to estimate the labor hours and thereby much of the cost of a manufactured good that is built in significant quantities

Learning, Unlearning and Re-Learning Curves Alan Jones, 2018-09-13 Learning Unlearning and Re-learning Curves Volume IV of the Working Guides to Estimating Forecasting series focuses in on Learning Curves and the various tried and tested models of Wright Crawford DeJong Towill Bevis and others It explores the differences and similarities between the various models and examines the key properties that Estimators and Forecasters can exploit A discussion about Learning Curve Cost Drivers leads to the consideration of a little used but very powerful technique of Learning Curve modelling called Segmentation which looks at an organisation's complex learning curve as the product of multiple shallower learning curves Perhaps the biggest benefit is that it simplifies the calculations in Microsoft Excel where there is a change in the rate of learning observed or expected The same technique can be used to model and calibrate discontinuities in the learning process that result in setbacks and uplifts in time or cost This technique is compared with other better known techniques such as Anderlohr's Equivalent Unit Learning is another relative new technique that can be used alongside traditional completed unit learning to give an early warning of changes in the rates of learning Finally a Learning Curve can be exploited to estimate the penalty of collaborative working across multiple partners Supported by a wealth of figures and tables this is a valuable resource for estimators engineers accountants project risk specialists as well as students of cost engineering

Beyond the Learning Curve Craig Speelman, Kim Kirsner, 2005-10-13 For years now learning has been at the heart of research within cognitive psychology How do we acquire new knowledge and new skills Are the principles underlying skill acquisition unique to learning or similar to those underlying other behaviours Is the mental system essentially modular or is the mental system a simple product of experience a product that inevitably reflects the shape of the external world with all of its specialisms and similarities This new book takes the view that learning is a major influence on

the nature of the processes and representations that fill our minds Throughout the authors review and consider the areas of skill acquisition and lexical representation to illustrate the effects that practice can have on cognitive processes They also draw parallels between theories in physical and biological domains to propose not only a new theory of mental function but also demonstrate that the mind is essentially subject to the same natural laws as the physical world In so doing Speelman and Kirsner present a new perspective on psychology one that identifies universal principles underlying all behaviours and one which contrasts markedly from our current focus on highly specific behaviours Accessibly written Beyond the Learning Curve is a thought provoking and challenging new text for students and researchers in the cognitive sciences *The*
