Distributed Algorithms for Message-Passing Systems Michel Raynal,2013-06-29 Distributed computing is at the heart of many applications It arises as soon as one has to solve a problem in terms of entities such as processes peers processors nodes or agents that individually have only a partial knowledge of the many input

parameters associated with the problem. In particular, each entity cooperating towards the common goal cannot have an instantaneous knowledge of the current state of the other entities. Whereas parallel computing is mainly concerned with efficiency and real time computing is mainly concerned with on time computing, distributed computing is mainly concerned with mastering uncertainty created by issues such as the multiplicity of control flows, asynchronous communication, unstable behaviors, mobility and dynamicity. While some distributed algorithms consist of a few lines, only their behavior can be difficult to understand and their properties hard to state and prove. The aim of this book is to present in a comprehensive way the basic notions, concepts and algorithms of distributed computing when the distributed entities cooperate by sending and receiving messages on top of an asynchronous network. The book is composed of seventeen chapters structured into six parts: distributed graph algorithms, in particular what makes them different from sequential or parallel algorithms; logical time and global states; the core of the book: mutual exclusion and resource allocation; high level communication abstractions; distributed detection of properties and distributed shared memory. The author establishes clear objectives per chapter and the content is supported throughout with illustrative examples, summaries, exercises and annotated bibliographies. This book constitutes an introduction to distributed computing and is suitable for advanced undergraduate students or graduate students in computer science and computer engineering; graduate students in mathematics interested in distributed computing and practitioners and engineers involved in the design and implementation of distributed applications. The reader should have a basic knowledge of algorithms and operating systems.

Knowledge-Based and Intelligent Information and Engineering Systems
 Juan D. Velásquez, Sebastián A. Ríos, 2009-09-30

On behalf of KES International and the KES 2009 Organising Committee we are very pleased to present these volumes, the proceedings of the 13th International Conference on Knowledge Based Intelligent Information and Engineering Systems held at the Faculty of Physical Sciences and Mathematics, University of Chile in Santiago de Chile. This year the broad focus of the KES annual conference was on intelligent applications, emergent intelligent technologies and generic topics relating to the theory, methods, tools and techniques of intelligent systems. This covers a wide range of interests, attracting many high quality papers which were subjected to a very rigorous review process. Thus these volumes contain the best papers carefully selected from an impressively large number of submissions on an interesting range of intelligent systems topics. For the first time in over a decade of KES events, the annual conference came to South America to Chile. For many delegates this represented the antipode of their own countries. We recognise the tremendous effort it took for everyone to travel to Chile and we hope this effort was rewarded. Delegates were presented with the opportunity of sharing their knowledge of high tech topics on theory and application of intelligent systems and establishing human networks for future work in similar research areas, creating new synergies and perhaps even new innovative fields of study. The fact that this occurred in an interesting and beautiful area of the world was an added bonus.
