

In a nuclear power plant binding energy of a nucleus is released by fission, which means breaking the nucleus into smaller fragments. Here one gram of the nucleus of uranium is isotope ^{235}U releases energy at the rate of 1 MW per day whereas 2.6 tons of coal produces the same amount of power in a conventional thermal power plant. The process of fission is carried out in a nuclear reactor. Thus the nuclear reactor is a very efficient source of energy because a small amount of fissile material produces a large amount of energy.

Q.9 List the advantages of nuclear power plants over conventional thermal power plants. (4)

Ans

- (i) A nuclear power plant is completely free of air pollution.
- (ii) It requires very little fuel in terms of volume and weight and therefore poses no transportation problems. The nuclear power plant may be sited, independently of nuclear fuel supplies, close to load centers. However safety considerations require that these plants be normally located away from populated areas.
- (iii) When one gram of pure uranium is completely fissioned it will create as much heat as the burning of 1500 tons of coal.
- (iv) Whereas the stock of coal is limited and the supply of coal will go down in the coming decades, it is the nuclear energy that is promising. Nuclear power plants will therefore be important sources of electrical power in future.

Q.10 Discuss briefly the solid state circuits used for the stator voltage control of induction motor drives. (7)

Ans : Fig 1E1 shows the block diagram for a scheme of stator voltage control. Here the ratio V/f is kept constant, with the frequency being varied by means of an inverter. This in turn will help in maintaining the field flux constant. The rectifier and inverter are rigged by means of the thyristors or GTOs or MOSFETs. Because of its high cost, this type of control is justified only for drives wherein rugged, maintenance-free characteristics of the induction motor are essential.
