Klugman, Harry H. Panjer, Gordon E. Willmot, 1998-01-29 Much of actuarial science consists of constructing and analyzing mathematical models that describe how funds flow into and out of an insurance system This book examines contemporary topics such as risk theory and economics credibility and stochastic processes with a focus on the loss process or the outflow of cash due to the payment of benefits **Loss Models** Stuart A. Rosenberger, John M. Lachin, 2004-03-24 A unique overview that melds the concepts of conditional probability and stochastic

processes into real life applications The role of randomization techniques in clinical trials has become increasingly important This comprehensive guide combines both the applied aspects of randomization in clinical trials with a probabilistic treatment of properties of randomization Taking an unabashedly non Bayesian and nonparametric approach to inference the book focuses on the linear rank test under a randomization model with added discussion on likelihood based inference as it relates to sufficiency and ancillarity Developments in stochastic processes and applied probability are also given where appropriate Intuition is stressed over mathematics but not without a clear development of the latter in the context of the former Providing a consolidated review of the field the book includes relevant and practical discussions of The benefits of randomization in terms of reduction of bias Randomization as a basis for inference Covariate adaptive and response adaptive randomization Current philosophies controversies and new developments With ample problem sets theoretical exercises and short computer simulations using SAS Randomization in Clinical Trials Theory and Practice is equally useful as a standard textbook in biostatistics graduate programs as well as a reliable reference for biostatisticians in practice

**Statistical Group Comparison** Tim Futing Liao, 2011-09-20 An incomparably useful examination of statistical methods for comparison The nature of doing science be it natural or social inevitably calls for comparison Statistical methods are at the heart of such comparison for they not only help us gain understanding of the world around us but often define how our research is to be carried out The need to compare between groups is best exemplified by experiments which have clearly defined statistical methods However true experiments are not always possible What complicates the matter more is a great deal of diversity in factors that are not independent of the outcome Statistical Group Comparison brings together a broad range of statistical methods for comparison developed

over recent years The book covers a wide spectrum of topics from the simplest comparison of two means or rates to more recently developed statistics including double generalized linear models and Bayesian as well as hierarchical methods Coverage includes Testing parameter equality in linear regression and other generalized linear models GLMs in order of increasing complexity Likelihood ratio Wald and Lagrange multiplier statistics examined where applicable Group comparisons involving latent variables in structural equation modeling Models of comparison for categorical latent variables Examples are drawn from the social political economic and biomedical sciences many can be implemented using widely available software Because of the range and the generality of the statistical methods covered researchers across many disciplines beyond the social political economic and biomedical sciences will find the book a convenient reference for many a research situation where comparisons may come naturally
