Fracture S. G. Pantelakis, C. A. Rodopoulos, 2009-02-14 Within the last thirty years there is a growing acknowledgement that prevention of catastrophic failures necessitates engagement of a large pool of expertise. Herein it is not excessive to seek advice from disciplines like materials science, structural engineering, mathematics, physics, reliability engineering and even economics. Today's engineering goals, independently of size, do not have the luxury of being outside a global perspective. Survival of the integrated markets and financial systems require a web of safe transportation, energy production and product manufacturing. It is perhaps the first decade in engineering history that multidisciplinary proaching is not just an idea that needs to materialise but has matured beyond infancy. We can witness such transition by examining engineering job descriptions and postgraduate curricula. The undertaking of organising a conference to reflect the above was not easy and definitely not something that was brought to life without a lot of work and commitment. The 1st Conference of Engineering Against Fracture from its conceptual day until completion was designed in a way of underlying the need of bringing all the key players on a common ground that once properly cultivated can flourish. To achieve that the conference themes were numerous and despite their in principle notional differences it was apparent that the attendees established such common ground through argumentation. The reader can see this from the variety of research areas reflected by the works and keynote lecturers presented.

Material Selections by a Hybrid Multi-Criteria Approach Fabrizio D'Errico, 2015-01-16 This Brief presents a new method that is based on the author and his students' shared experience in applying a structured procedure that has as its main goal the creation of a material selection technique that uses language and employs a platform that is not restricted to engineers. Based on a hybrid approach that exploits both traditional and semi-quantitative concepts, it moves forward step by step and uses a platform based on a Quality Function Deployment matrix framework. Candidate materials are screened out and finally assessed by two user-friendly graphic analysis tools: one based on the value curve of the product and the other on an original Bubble Maps tool. The Brief is written for all those whose aim is for a better

understanding of how to integrate and speed up the entire product development process from the initial product concept and engineering design phases to design specs manufacturability and product marketing with optimal choice of materials
