Wang, Yung-Tse Hung, Nazih K. Shammam, 2007-11-13 The past 30 years have seen the emergence of a growing desire worldwide to take positive actions to restore and protect the environment from the degrading effects of all forms of pollution air noise solid waste and water Because pollution is a direct or indirect consequence of waste the seemingly idealistic demand for zero discharge can be construed as an unrealistic demand for zero waste However as long as waste exists we can only attempt to

abate the subsequent pollution by converting it to a less noxious form Three major questions usually arise when a particular type of pollution has been identified 1 How serious is the pollution 2 Is the technology to abate it available and 3 Do the costs of abatement justify the degree of abatement achieved The principal intention of the Handbook of Environmental Engineering series is to help readers formulate answers to the last two questions The traditional approach of applying tried and true solutions to specific pollution problems has been a major contributing factor to the success of environmental engineering and has accounted in large measure for the establishment of a methodology of pollution control However realization of the ever increasing complexity and interrelated nature of current environmental problems makes it imperative that intelligent planning of pollution abatement systems be undertaken

Cost-efficient Wastewater Treatment Technologies

Mahmoud Nasr, Abdelazim M. Negm, 2023-01-01 This is the second of two volumes that together provide a comprehensive overview of the current sustainable and low cost wastewater treatment technologies applied in communities that lack the financial and technical resources needed for an environmental disease prevention and health nexus This book reviews engineered wastewater treatment technologies and discusses their application in regard to greenhouse gas emissions natural resource utilization land use and energy and water savings The chapters from expert contributors cover topics such as aerobic and anaerobic biological treatments chemical treatments and precipitation and disinfection Readers will also learn about simplified and low energy wastewater treatment plants strategies for wastewater reuse and nanotechnologies for wastewater environmental management The feasibility regarding time and cost of implementing such technologies is also discussed in this book and particular attention is given to the removal of conventional and emerging pollutants toxicants and heavy metals

Given the breadth and depth of its coverage the book offers an invaluable source of information for researchers students and environmental managers alike **Handbook of Downstream Processing** E. Goldberg,2012-12-06 The last two decades have seen a phenomenal growth of the field of genetic or biochemical engineering and have witnessed the development and ultimately marketing of a variety of products typically through the manipulation and growth of different types of microorganisms followed by the recovery and purification of the associated products The engineers and biotechnologists who are involved in the full scale process design of such facilities must be familiar with the variety of unit operations and equipment and the applicable regulatory requirements This book describes current commercial practice and will be useful to those engineers working in this field in the design construction and operation of pharmaceutical and biotechnology plants It will be of help to the chemical or pharmaceutical engineer who is developing a plant design and who faces issues such as Should the process be batch or continuous or a combination of batch and continuous How should the optimum process design be developed Should one employ a new revolutionary separation which could be potentially difficult to validate or use accepted technology which involves less risk Should the process be run with ingredients formulated from water for injection deionized water or even filtered tap water Should any of the separations be run in cold rooms or in glycol jacketed lines to minimize microbial growth where sterilization is not possible Should the process equipment and lines be designed to be sterilized in place cleaned in place or should every piece be broken down cleaned and autoclaved after every turn
