

Volcanoes and Plate Tectonics

Volcanic belts form along the boundaries of Earth's plates.

- At plate boundaries large pieces of earth's crust diverge (pull apart) or converge (push together) -- as a result, the crust often breaks (fractures) and allows magma to reach the surface.

- Some volcanoes result from "hot spots" in the Earth's mantle....a hot spot is an area where material flows deep within the mantle rises and then melts, forming magma. A volcano forms above a hot spot where magma erupts through the crust and reaches the surface. Because hot spot volcanoes form far in the middle of plates far from plate boundaries and other hot spots occur near plate boundaries.

"Hotspot" Volcano

Physical Properties

A physical property is any characteristic of a substance that can be observed or measured without changing the composition of the substance (ex. Density, hardness, melting point, boiling point, magnetism)

Chemical Properties

A chemical property is any property that produces a change to the composition of matter (ex. ability to burn, the ability to react, or combine with other substances)
