Antenna Handbook Y.T. Lo, S. W. Lee, 2013-06-29 Techniques based on the method of modal expansions the Rayleigh Stevenson expansion in inverse powers of the wavelength and also the method of moments solution of integral equations are essentially restricted to the analysis of electromagnetic radiating structures which are small in terms of the wavelength It therefore becomes necessary to employ approximations based on high frequency techniques for performing an efficient analysis of electromagnetic radiating systems that are large in terms of the wavelength One of the most versatile and useful high frequency techniques is the geometrical theory of diffraction GTD which was developed around 1951 by J B Keller 1 2 3 A class of diffracted rays are introduced systematically in the GTD via a generalization of the concepts of classical geometrical optics GO According to the GTD these diffracted rays exist in addition to the usual incident reflected and transmitted rays of GO The diffracted rays in the GTD originate from certain localized regions on the surface of a radiating structure such as at discontinuities in the geometrical and electrical properties of a surface and at points of grazing incidence on a smooth convex surface as illustrated in Fig 1 In particular the diffracted rays can enter into the GO shadow as well as the lit regions Consequently the diffracted rays entirely account for the fields in the shadow region where the GO rays

years ago the author together with eight co authors edited a textbook Remote Sensing for Environmental Sciences within the
series on Ecological Studies of Springer Verlag At that time there were not yet many books available on remote sensing The
decade that has elapsed was marked by a spectacular development in this field This development took place in many
directions by widening the areas of application by improvements of the methods and the sensors by the introduction of new
versatile platforms but also by deepening the knowledge of the theoretical foundations This evolution improved the ability to
explain the interaction between electromagnetic radiation and natural objects which in its turn allowed for better
modelization and for the creation of refined mathematical tools in the processing of remotely sensed data and in the
determination of the physical status of remote objects The community of research workers engaged in development and use
of remote sensing methods changed accordingly from a modest group of scientists in the early 1970 s to a considerable
branch of specialized and interdisciplinary activity The training of students had to be adapted to cope with the increasing
number of people entering this new field and with the increasing quality of the material to be presented **Books in Series**
