when I was asked by Springer Verlag to prepare a second edition of this volume on Linear Optimization and Extensions which not exactly contrary to my personal expectations has apparently been accepted reasonably well by the global optimization community My objective in putting this book together was originally and still is to detail the major algorithmic ideas in linear optimization that have evolved in the past fifty years or so and that have changed the historical optimization landscape in substantial ways both theoretically and computationally While I may have overlooked the importance of some very recent developments the work by Farid Alizadeh which generalizes linear programming to sem i definite programming is perhaps a candidate for one of my omissions I think that major new breakthroughs on those two fronts that interest me theory and computation have not occurred since this book was published originally As a consequence I have restricted myself to a thorough re working of the original manuscript with the goal of making it more readable Of course I have taken this opportunity to correct a few Sch neitsfehler of the first edition and to add some illustrations The index to this volume has been extended substantially to permit a hurried reader a quicker glance at the wealth of topics that were covered nevertheless already in the first edition As was the case with the first edition Dr **Feasibility and Infeasibility in**
