Digital VLSI Design with Verilog John Williams, 2008-06-06 Verilog and its usage has come a long way since its original invention in the mid 80s by Phil Moorby At the time the average design size was around ten thousand gates and simulation to validate the design was its primary usage But between then and now designs have increased dramatically in size and automatic logic synthesis from RTL has become the standard design flow for most design Indeed the language has evolved and been re standardized too Over the years many books have been written about Verilog My own coauthored with Phil Moorby had the goal of defining the language and its usage providing amplex along the way It has been updated with five new editions as the language and its usage evolved However this new book takes a very different and unique view that of the designer John Michael Williams has a long history of working and teaching in the field of IC and ASIC design He brings an in depth presentation of Verilog and how to use it with logic synthesis tools no other Verilog book has dealt with this topic as deeply as he has If you need to learn Verilog and get up to speed quickly to use it for synthesis this book is for you It is sectioned around a set of lessons including presentation and explanation of new concepts and approaches to design along with lab sessions

VLSI Design Methodologies for Digital Signal Processing Architectures Magdy A. Bayoumi, 2012-12-06 Designing VLSI systems represents a challenging task It is a transformation among different specifications corresponding to different levels of design abstraction behavioral structural and physical The behavioral level describes the functionality of the design It consists of two components static and dynamic The static component describes operations whereas the dynamic component describes sequencing and timing The structural level contains information about components control and connectivity The physical level describes the constraints that should be imposed on the floor plan the placement of components and the geometry of the design Constraints of area speed and power are also applied at this level To implement such multilevel transformation a design methodology should be devised taking into consideration the constraints limitations and properties of each level The mapping process between any of these domains is non isomorphic A single behavioral component may be transformed into more than one structural component Design methodologies are the most recent evolution in the design automation era which started off with the introduction and subsequent usage of module generation especially for regular structures such as PLAs and memories A design methodology should offer an integrated design system rather than a set of separate unrelated routines and tools A general outline of a desired integrated design system is as follows Decide on a certain unified framework for all design levels Derive a design method based on this framework Create a design environment to implement this design method
