seafloor spreading

Alfred Wegener was one of the first people to suggest that all of the
1. **Continents** were joined together in the past. He called the one large
continent 2. **Pangaea**. Evidence exists to support his hypothesis.
For example, similar fossils have been found in South America and
3. **Africa**. Also, fossils of warm weather plants have been found in
the 4. **Arctic**. Similar 5. **rock** structures exist in
the Appalachian Mountains and in Greenland and western Europe. But until clues on
the ocean floor led to Harry Hess's theory of 6. **seafloor spreading**, scientists
could not think of how the continents might move.

Directions: Study the following diagram of the seafloor. Then match the letters to the statements below.

- A** 7. Molten rock flows onto the seafloor and hardens as it cools.
- B** 8. Hot, molten rock is forced upward toward the seafloor at a mid-ocean ridge.
- D** 9. New seafloor moves away from the ridge, cools, becomes denser, and sinks.
- C** 10. Molten rock pushes sideways in both directions as it rises, moving the mantle with it.
