

Strength of Materials → Shear stress

Problem 02

Given:

Diameter of pin at B = 20 mm

→ **Required:** Shearing stress of the pin at B

Solution:

From the FBD:

$$\sum M_C = 0$$

$$0.25R_{BV} = 0.25(40 \sin 35^\circ) + 0.2(40 \cos 35^\circ)$$

$$R_{BV} = 49.156 \text{ kN}$$

$$\sum F_H = 0$$

$$R_{BH} = 40 \cos 35^\circ$$

$$R_{BH} = 32.766 \text{ kN}$$

$$R_B = \sqrt{R_{BH}^2 + R_{BV}^2}$$

$$R_B = \sqrt{32.766^2 + 49.156^2}$$

$$R_B = 59.076 \text{ kN} \rightarrow \text{shear force of pin at B}$$

$$V_B = \tau_B A \rightarrow \text{double shear}$$

$$59.076(1000) = \tau_B \left\{ 2 \left[\frac{1}{4} \pi (20^2) \right] \right\}$$

$$\tau_B = 94.02 \text{ MPa} \rightarrow \text{answer}$$

MATERIALS SCIENCE AND ENGINEERING : PROBLEMS WITH SOLUTIONS SHETTY, M.N., 2015-12-01 This book with analytical solutions to 260 select problems is primarily designed for the second year core course on materials science. The treatment of the book reflects the author's experience of teaching this course comprehensively at IIT Kanpur for a number of years to the students of engineering and 5 year integrated disciplines. The problems have been categorised into five sections covering a wide range of solid state properties. Section 1 deals with the dual representation of a wave and a particle and then comprehensively explains the behaviour of particles within potential barriers. It provides solutions to the problems that how the energy levels of a free atom lead to the formation of energy bands in solids. The statistics of the distribution of particles in different energy states in a solid has been detailed leading to the derivation of Maxwell Boltzmann Bose Einstein and Fermi Dirac statistics and their mutual relationships. Quantitative derivation of the Fermi energy has been obtained by considering free electron energy distribution in solids and then considering Fermi Dirac distribution as a function of temperature. The derivation of the Richardson's equation and the related work function has been quantitatively dealt with. The phenomenon of tunnelling has been dealt with in terms of quantum mechanics whereas the band structure and electronic properties of materials are given quantitative treatment by using Fermi Dirac distribution function. Section 2 deals with the nature of the chemical bonds types of bonds and their effect on properties followed by a detailed presentation of crystal structures of some common materials and a discussion on the structures of C60 and carbon nanotubes. Coordination and packing in crystal structures are considered next followed by a detailed X ray analysis of simple crystal structures imperfections in crystals diffusion phase equilibria and mechanical behaviour. Section 3 deals with thermal and electrical properties and their mutual relationships. Calculations of Debye frequency Debye temperature and Debye specific heat are presented in great detail. A brief section on superconductivity considers both the conventional and the high TC superconductors. Sections 4 and 5 deal with the magnetic and dielectric materials considering magnetic properties from the point of view of the band theory of solids. Crystal structures of some common ferrites are given in detail. Similarly the displacement characteristics in dielectrics are considered from their charge displacements giving rise to some degree of polarization in the materials. **Strength of Materials** Edward Rose Maurer, Morton Owen Withey, 1929 **Algebraic Equations of Linear Elasticity** Lester W. Schmerr Jr., 2024-09-09 This book describes a second generation force based method emerging from a general formulation where the partial differential equations of elasticity are replaced by equivalent algebraic equations. These algebraic equations of linear elasticity can be used to solve statically indeterminate problems in

reduced forms that define either the new second generation force based approach or a new displacement based approach The new force based method can serve as the basis for teaching students at many technical levels how to solve equilibrium problems directly for the forces present In elasticity courses the derivation and use of the algebraic equations of linear elasticity can show how the difficulties of dealing with partial differential equations may be avoided by transforming those equations into algebraic equations with work energy concepts In a finite element course a force based finite element method can be described along with the traditional displacement based approach to demonstrate how the two methods provide alternative ways for solving complex structural problems Serving as a resource for including second generation force based methods in solid mechanics courses of an engineering curriculum and as a robust learning resource the book is ideal for instructors and for students practicing engineers and researchers

Elementary Chemical Thermodynamics Bruce H. Mahan,2013-02-13 This straightforward presentation emphasizes chemical applications of thermodynamics as well as physical interpretations offering students an introduction that s both

interesting and coherent It considers chemical behavior in terms of energy and entropy and it explains the ways in which the magnitude of energy and entropy changes are dictated by atomic properties All concepts are presented in a simplified mathematical context making this an ideal text for a beginning course in thermodynamics The author considers the first and second laws of thermodynamics in turn after which he proceeds to applications of thermodynamic principles He devotes considerable attention to the concept of entropy emphasizing the interpretation of entropy changes and chemical behavior in terms of qualitative molecular properties Students gain a familiarity with the entropy concept that will form a solid foundation for later courses and more formal thermodynamic treatments
