

## Cell Cycle and Mitosis

### THE CELL CYCLE

The cell cycle, or cell-division cycle, is the series of events that take place in a eukaryotic cell between its formation and the moment it replicates itself. These events can be divided in two main parts: **interphase** (in between divisions phase grouping **G<sub>1</sub> phase**, **S phase**, **G<sub>2</sub> phase**), during which the cell is forming and carries on with its normal metabolic functions; the **mitotic phase** (**M mitosis**), during which the cell is replicating itself. Thus, cell-division cycle is an essential process by which a single-cell fertilized egg develops into a mature organism and the process by which hair, skin, blood cells, and some internal organs are formed.

1. What is meant by the cell cycle or cell division cycle? **events that take place in a eukaryotic cell between its formation and the moment it replicates itself**
2. In what type of cells --- prokaryotes or eukaryotes --- does the cell cycle occur? **eukaryotic cell**
3. Name the 2 main PHASES of the cell cycle. **Interphase, mitotic phase (M mitosis)**
4. \_\_\_ **interphase** \_\_\_\_\_ is in between the times when a cell is dividing.
5. What is occurring in a cell during interphase? **the cell is forming and carries on with its normal metabolic functions**
6. What is occurring during the mitosis phase? **the cell is replicating itself**
