Promising Practices in Undergraduate Science, Technology, Engineering, and Mathematics Education National Research Council, Division of Behavioral and Social Sciences and Education, Board on Science Education, Planning Committee on Evidence on Selected Innovations in Undergraduate STEM Education, 2011-04-19

Numerous teaching learning assessment and institutional innovations in undergraduate science technology engineering and mathematics STEM education have emerged in the past decade Because virtually all of these innovations have been developed independently of one another their goals and purposes vary widely Some focus on making science accessible and meaningful to the vast majority of students who will not pursue STEM majors or careers others aim to increase the diversity of students who enroll and succeed in STEM courses and programs still other efforts focus on reforming the overall curriculum in specific disciplines In addition to this variation in focus these innovations have been implemented at scales that range from individual classrooms to entire departments or institutions By 2008 partly because of this wide variability it was apparent that little was known about the feasibility of replicating individual innovations or about their potential for broader impact beyond the specific contexts in which they were created The research base on innovations in undergraduate STEM education was expanding rapidly but the process of synthesizing that knowledge base had not yet begun If future investments were to be informed by the past then the field clearly needed a retrospective look at the ways in which earlier innovations had influenced undergraduate STEM education To address this need the National Research Council NRC convened two public workshops to examine the impact and effectiveness of selected STEM undergraduate education innovations This volume summarizes the workshops which addressed such topics as the link between learning goals and evidence promising practices at the individual faculty and institutional levels classroom based promising practices and professional development for graduate students new faculty and veteran faculty The workshops concluded with a broader examination of the barriers and opportunities associated with systemic change

Integrated Optics: Theory and Technology Robert G. Hunsperger, 2013-11-11 Our intent in producing this book was to provide a text that would be comprehensive enough for an introductory course in integrated optics yet concise enough in its mathematical derivations to be easily readable by a practicing engineer who desires an overview of the field The response to the first edition has indeed been gratifying unusually strong demand has caused it to be sold out during the initial year of publication thus providing us

with an early opportunity to produce this updated and improved second edition. This development is fortunate because integrated optics is a very rapidly progressing field with significant new research being regularly reported. Hence a new chapter, Chap 17, has been added to review recent progress and to provide numerous additional references to the relevant technical literature. Also thirty five new problems for practice have been included to supplement those at the ends of chapters in the first edition. Chapters I through 16 are essentially unchanged except for brief updating revisions and corrections of typographical errors. Because of the time limitations imposed by the need to provide an uninterrupted supply of this book to those using it as a course text, it has been possible to include new references and to briefly describe recent developments only in Chapter 17. However we hope to provide details of this continuing progress in a future edition.

*Integrated Optics: Theory and Technology* R. G. Hunsperger, 2013-11-11. This book is an introduction to the theory and technology of integrated optics for graduate students in electrical engineering and for practicing engineers and scientists who wish to improve their understanding of the principles and applications of this relatively new and rapidly growing field. Integrated Optics is the name given to a new generation of optoelectronic systems in which the familiar wires and cables are replaced by light waveguiding optical fibers and conventional integrated circuits are replaced by optical integrated circuits (OICs). In an OIC the signal is carried by means of a beam of light rather than by an electrical current and the various circuit elements are interconnected on the substrate wafer by optical waveguides. Some advantages of an integrated optic system are reduced weight, increased bandwidth or multiplexing capability, resistance to electromagnetic interference, and low loss signal transmission. Because of the voluminous work that has been done in the field of integrated optics since its inception in the late 1960s, the areas of fiber optics and optical integrated circuits have usually been treated separately at conferences and in textbooks. In the author's opinion this separation is unfortunate because the two areas are closely related. Nevertheless it cannot be denied that it may be a practical necessity.
