

Prisms & Cylinders – Surface Area

Triangular & Polygonal Prisms

Right prisms can have any polygonal base. This means that you might have a triangle, a rectangle, trapezoid, pentagon, or any other of the polygons you have studied. For right prisms the surface area will always be the area of the two bases plus the area of the rectangular sides. Triangular prisms are sometimes problematic because students think there are four faces. Remember that a triangular prism has only 3 lateral sides. A net for a triangular prism would look like this:

You may need to use some of the tools from the lesson over regular polygons in order to find the area of the polygonal bases of some prisms. A net for a hexagonal prism would look like this:

What real world applications use these concepts?

As mentioned earlier, real world applications such as painting, wallpapering, building houses, and shipping containers are just a few of the applications of surface area. For this reason you must always remember your labels!

Example 1

Suppose a new company is making curved green beans. How many cans can be made out of a piece of sheet metal that is 1 square meter in each can is shaped as shown?

First, find the surface area of each can:

$$S = 2\pi(0.03)^2 + 1.1(2\pi)(0.03) = 648.96\text{cm}^2$$

One square meter of material is 10,000 cm^2 . So we will divide this by the material needed for one can:
 $10,000 \div 648.96 = 15.411$

The company can make 15 cans out of 1 square meter of material.
