Nanostructured Solar Cells Narottam Das, 2017-02-22. Nanostructured solar cells are very important in the renewable energy sector as well as in environmental aspects because it is environment-friendly. The nano-grating structures such as triangular or conical shaped have a gradual change in refractive index which acts as a multilayer antireflective coating that is leading to reduced light reflection losses over broadband ranges of wavelength and angle of incidence. There are different types of losses in solar cells that always reduce the conversion efficiency, but the light reflection loss is the most important factor that decreases the conversion efficiency of solar cells significantly. The antireflective coating is an optical coating which is applied to the surface of lenses or any optical devices to reduce the light reflection losses. This coating assists for the light trapping, capturing capacity, or improves the efficiency of optical devices such as lenses or solar cells. Hence the multilayer antireflective coatings can reduce the light reflection losses and increase the conversion efficiency of nanostructured solar cells.

An Introduction to Semiconductor Devices by Donald Neamen is designed to provide a fundamental understanding of the characteristics, operations, and limitations of semiconductor devices. In order to meet this goal, the book brings together explanations of fundamental physics of semiconductor materials and semiconductor device physics. This new text provides an accessible and modern approach to the material. Aimed at the undergraduate level, Neamen keeps coverage of quantum mechanics to a minimum and labels the most advanced material as optional. MOS transistors are covered before bipolar transistors to reflect the dominance of MOS coverage in today's world.
