Numerical Solution for a 3D Rectangular Waveguide Using the Finite Volume Control Method Elias Antoun Alwan, 2009

In this thesis a numerical method is introduced to solve a 3D rectangular waveguide using the Finite Volume Control Method. Essentially this numerical method finds its main applications in Computational Fluid Dynamics problems and has been rarely used in Electromagnetics. The 3D rectangular waveguide under consideration is coupled through its apertures to two infinite conducting planes. The aperture's shape and size are the same as the waveguide cross section. The work starts by deriving the analytical forms of the domain and boundary equations in order to discretize them using the Finite Volume Control method. The governing equation inside the waveguide is called the Helmholtz equation. All the boundary equations except those related to the apertures are known as the Von Neumann boundary conditions. The main complexity arises in the discretization of the aperture boundary equations. In fact those equations do not exhibit any of the classic forms of boundary equations recognized in the Finite Volume Control method. Therefore a new problem is introduced. This new problem adopts a Surface Control approach over the two apertures where each aperture is divided into control areas of dimensions equal to the control volumes of the initial problem. This results in three dependent systems of algebraic simultaneous equations that require a computational technique to be solved. Consequently a code is created to solve the three systems using Matlab R2008b. The code starts by meshing the domain. Then a hybrid direct and iterative approach is adopted to solve the systems of equations. The best case results lead to residual in the range of ten to the power minus four. This can be considered an acceptable upper bound for convergence since Matlab does not tolerate a large number of nodes which certainly affects the accuracy of the results and the convergence criterion. The results are then validated using Ansoft HFSS v10.0. The Matlab results are very close to the HFSS results with minor discrepancies mainly due to capacity and memory limitations imposed by Matlab.

Numerical Techniques in Electromagnetics with MATLAB Matthew N.O. Sadiku, 2015-09-11. Despite the dramatic growth in the availability of powerful computer resources the EM community lacks a comprehensive text on the computational techniques used to solve EM problems. The first edition of *Numerical Techniques in Electromagnetics* filled that gap and became the reference of choice for thousands of engineers, researchers and students. This third edition of the bestselling text reflects the continuing increase in awareness and use of numerical techniques and incorporates advances and refinements made in recent years. Most notable among these are the improvements made to the standard algorithm for the finite difference time domain (FDTD) method and treatment of absorbing boundary conditions in FDTD, finite element and transmission line matrix methods. The author also has added a chapter on the method of lines. *Numerical Techniques in Electromagnetics with MATLAB* Third Edition continues to teach readers how to pose, numerically analyze and solve EM problems to give them the ability to expand their problem solving skills using a variety of methods and to prepare them for research in electromagnetism. Now the Third Edition goes even further toward providing a comprehensive resource that addresses all of the most useful computation methods for EM problems and includes MATLAB code instead of FORTRAN.
