Subramaniam, 2015-08-01 Mathematics and Science education have both grown in fertile directions in different geographic regions Yet the mainstream discourse in international handbooks does not lend voice to developments in cognition curriculum teacher development assessment policy and implementation of mathematics and science in many countries Paradoxically in spite of advances in information technology and the flat earth syndrome old distinctions and biases between different groups of researcher s persist In addition limited accessibility to conferences and journals also contribute to this problem The International Sourcebooks in Mathematics and Science Education focus on under represented regions of the world and provides a platform for researchers to showcase their research and development in areas within mathematics and science education The First Sourcebook on Asian Research in Mathematics Education China Korea Singapore Japan Malaysia and India provides the first synthesized treatment of mathematics education that has both developed and is now prominently emerging in the Asian and South Asian world The book is organized in sections coordinated by leaders in mathematics education in these countries and editorial teams for each country affiliated with them The purpose of unique sourcebook is to both consolidate and survey the established body of research in these countries with findings that have influenced ongoing research agendas and informed practices in Europe North America and other countries in addition to serving as a platform to showcase existing research that has shaped teacher education curricula and policy in

these Asian countries The book will serve as a standard reference for mathematics education researchers policy makers practitioners and students both in and outside Asia and complement the Nordic and NCTM perspectives Geometries Alekseĭ Bronislavovich Sosinskiĭ,2012 The book is an innovative modern exposition of geometry or rather of geometries it is the first textbook in which Felix Klein s Erlangen Program the action of transformation groups is systematically used as the basis for defining various geometries The course of study presented is dedicated to the proposition that all geometries are created equal although some of course remain more equal than others The author concentrates on several of the more distinguished and beautiful ones which include what he terms toy geometries the geometries of Platonic bodies discrete geometries and classical continuous geometries The text is based on first year semester course lectures delivered at the Independent University of Moscow in 2003 and 2006 It is by no means a formal algebraic or analytic treatment of geometric topics but rather a highly visual exposition containing upwards of 200 illustrations The reader is expected to possess a familiarity with elementary Euclidean geometry albeit those lacking this knowledge may refer to a compendium in Chapter 0 Per the author s predilection the book contains very little regarding the axiomatic approach to geometry save for a single chapter on the history of non Euclidean geometry but two Appendices provide a detailed treatment of Euclid s and Hilbert s axiomatics Perhaps the most important aspect of this course is the problems which appear at the end of each chapter and are supplemented with answers at the conclusion of the text By analyzing and solving these problems the reader will become capable of thinking and working geometrically much more so than by simply learning the theory Ultimately the author makes the distinction between concrete mathematical objects called geometries and the singular geometry which he understands as a way of thinking about mathematics Although the book does not address branches of mathematics and mathematical physics such as Riemannian and Kahler manifolds or say differentiable manifolds and conformal field theories the ideology of category language and transformation groups on which the book is based prepares the reader for the study of and eventually research in these important and rapidly developing areas of contemporary mathematics *Geometric Representations of Perceptual Phenomena* R. Duncan Luce,Donald D. Hoffman,Michael D'Zmura,Geoffrey Iverson,A. Perspectives on Teaching and Learning Mathematics with Virtual Manipulatives Patricia S. Moyer-Packenham, 2016-06-21

This book explores terminology frameworks and research being conducted worldwide on virtual manipulatives. It brings together international authors who provide their perspectives on virtual manipulatives in research and teaching. By defining terminology, explaining conceptual and theoretical frameworks, and reporting research, the authors provide a comprehensive foundation on the study and use of virtual manipulatives for mathematics teaching and learning. This foundation provides a common way for researchers to communicate about virtual manipulatives and build on the major works that have been conducted on this topic. By discussing these big ideas, the book advances knowledge for future research on virtual manipulatives as these dynamic tools move from computer platforms to hand-held touch screen and augmented platforms.

Tyler, 2003-01-30 Symmetry is a fundamental principle of broad concern from the physical sciences to art and design Much of its significance derives from the perceptual appeal of symmetry to the human brain as testified by its universal inclusion in those icons of decor oriental rugs Although there have been many books on physical symmetry none have addressed the issue of human symmetry perception This comprehensive collection provides a wide range of approaches to the study of how we see symmetries from evolutionary through empirical to extended theoretical treatments The book is an invaluable resource for those concerned with the methods and analytic approaches to this challenging topic It soon becomes evident that symmetry perception is not a simple example of neural pattern processing since the essence of symmetry is to transcend the patterns of which it is composed Consequently this volume contains many novel methods relevant to the analysis of the long range processing of mid level vision rather than early neural filtering It provides both a historical background and an intellectual stimulant to future developments in this lapidary field of study
