Characterization, Modeling, Monitoring, and Remediation of Fractured Rock National Academies of Sciences, Engineering, and Medicine, Division on Earth and Life Studies, Board on Earth Sciences and Resources, Committee on Geological and Geotechnical Engineering, Committee on Subsurface Characterization, Modeling, Monitoring, and Remediation of Fractured Rock, 2021-01-29 Fractured rock is the host or foundation for innumerable engineered structures related to energy water

waste and transportation Characterizing modeling and monitoring fractured rock sites is critical to the functioning of those infrastructure as well as to optimizing resource recovery and contaminant management

Characterization Modeling Monitoring and Remediation of Fractured Rock examines the state of practice and state of art in the characterization of fractured rock and the chemical and biological processes related to subsurface contaminant fate and transport This report examines new developments knowledge and approaches to engineering at fractured rock sites since the publication of the 1996 National Research Council report Rock Fractures and Fluid Flow Contemporary Understanding and Fluid Flow Fundamental understanding of the physical nature of fractured rock has changed little since 1996 but many new characterization tools have been developed and there is now greater appreciation for the importance of chemical and biological processes that can occur in the fractured rock environment The findings of Characterization Modeling Monitoring and Remediation of Fractured Rock can be applied to all types of engineered infrastructure but especially to engineered repositories for buried or stored waste and to fractured rock sites that have been contaminated as a result of past disposal or other practices The recommendations of this report are intended to help the practitioner researcher and decision maker take a more interdisciplinary approach to engineering in the fractured rock environment This report describes how existing tools some only recently developed can be used to increase the accuracy and reliability of engineering design and management given the interacting forces of nature With an interdisciplinary approach it is possible to conceptualize and model the fractured rock environment with acceptable levels of uncertainty and reliability and to design systems that maximize remediation and long term performance Better scientific understanding could inform regulations policies and implementation guidelines related to infrastructure development and operations The recommendations for research and applications to enhance practice of this book make it a valuable resource for students and practitioners in this field
